MacTerminal 1.1 disk buzz annonyance.

I have finally received the first "real" release of MacTerminal from my Apple dealer. (Paid for it in February -- yes, I know that was stupid). It comes with a coupon to send in to get the "real, final" instruction book -- though the one that comes with it seems fine.

It seems OK. There is one incredibly annonying bug however: When in the "DON'T Record lines off top" mode, when nothing has come out on the screen for about 8 seconds, the floppy is spun up and down. Think about it. Most of the time, one is typing or receiving output. When you stop to think about something, just when you really start concentrating: BUZZ. As far as I can tell, nothing is actually being written on the disk (there is certainly no need to in this mode). A crufty pre-release I begged from my dealer had other problems, but not this one.

Anybody know a solution? I have resorted to popping the disk (once MacTerminal is going) via the paper clip trick. This works as long as you remember to push the disk back again before mousing around with anything that actually needs the disk. Hardly a nice solution.

Has anyone used the TASC compiler V2.0 with anything other than
DOS 3.3, namely diversi-DOS, and had it work correctly? I have
had some problems with this. Does any one have experience with
other applesoft compilers. If so, how do they compare.
How about a PRO-DOS compiler? I would like any info you might
have on the matter. Thanks Brent

I would be very happy if someone posted a FROMHEX program
written in (MS-)Basic for the Macintosh. Then, the Fonteditor
and Rmover are available to people not having a FROMHEX-application
yet. Of course the stand-alone version is welcome too (after

the Basic-version (this is the classical chicken and Mac-problem)).

Thanks in advance!!

>   development task ?
>   (* Prices approx. *)

$5000 Mac? I recall the Mac proces are down to $2195 US or so. This
is for a 128K Mac, which is what you want for development, because you
can't expect all your potential customers to have 512K Macs, and
anything that runs on 128K will run on 512K. $8000 Lisa? Aren't
Lisas available for $4000-5000? This would add up to about $7000
(plus serial cable) for a Lisa/Mac system... Not that bad.

The new BYTE has an ad (in the back pages) for 256K chips. They're
advertised as LOW PRICED, and are selling for $49.95. Sixteen of

those critters would cost you $800. So Apple is charging the Mac
owners a whole $200 more than the bare chips would cost, uninstalled.
What a rip-off! :-)

And no, I don't own any Apple stock and/or products.

Yes, exactly! Apple makes a substantial profit on each 128k Mac they
sell. They then start producing 512k Macs, and selling them to you for
$995 *plus* the trade-in on your old Mac. So they've sold you two Macs
for a total of almost $3500, and still have your old (128k) Mac to sell
again! They're in effect selling the same physical computer twice to
different people at $2500 a shot!

Pretty neat, from Apple's standpoint!

Does anybody have any experience with the 'Memory Master IIe 128K RAM card
from Applied Engineering (of Carlton Texas). I am seriously considering
buying this card, since it costs less than the Apple extended 80 column card
and provides more memory and is billed as being fully compatible with the
Apple card. (It uses the same kludge of putting the extra 40 columns in the
high bank. Oh well! You can't have everything!) Pleas tell me if you have
any experiences, either good or bad.

Also, does anybody have any suggestions for a good serial interface card.
It must provide (at least optionally) a fully transparent 8 bit data connection
to an RS232 interface at 300 and 1200 baud, and (again, at least optionally)
provide an interrupt to tell when it has a character (on input) or needs one
(on output). That doesn't sound like much, but I hear tell that there are
a lot that don't.

Please reply by mail and I will post a summary, if there is interest.

Thanks in advance!

I am curious about the term 'developer"s version'.

Is there a new class of Apple][users called 'developers'?

If so, how does one get on the list? I have written a few
programs I sold (nothing big) and wouldn't want to miss
any Prodos hints, etc.

Yes, I have seen this problem, it happened to me... Here's what ya gotta do:

Go into the "File Transfer" menu, set the Other systems type to:

          MacTerminal
 Make sure the other box is checked to XMODEM, you'll get it to work then.
The problem is that you have to tell macterminal to explicitly
RECIEVE a file, if the other program isn't macterminal, and Macput/get
look functionally like Mactermianl to a macintosh...

          'Hope that helps...

I am fed up with reading this on the net:
"I feel like a fool for spending xxx on yyy because it does not do zzz."
Would these people please just admit to themselves that they did a foolish thing
buying yyy, sell it for 50% xxx and figure out what they really want yyy to do.
After reading lots of reviews and playing with a Mac it is not hard to figure
out what it can do.
If you local dealer wont let you play with one, find another dealer.
For people interested in more exciting discussions of the Mac, I recommend fa.mac.

I can't believe how many people think of Apple as a religious patriarchy.
They are a computer company.

I just heard that there were four versions of the 128K logic
board made, and that the latest is identical with the 512K logic board.

If you bought your 128K Mac late, and have a waveless desoldering
tool, and have 16 265K chips and don't mind taking a chance,
then you can upgrade your own.

On the other hand, if you bought early, do not let go of your
ankles yet. You're still getting it, and more is on the way.

>Oh, yeah, if you paid the regular price ($2495...) for your Mac, you also
>get $250 worth of FREE software; MacProject and MacDraw as I understand.

Sounds like you did *NOT* pay the "regular" price. A good reason
to be satisfied. Those of us who did pay list price, thinking
that the machine would hold its value for a year or so, are feeling
very foolish, indeed.

>I am just a satisfied Macintosh owner who has a LOT (<- Heavy emphasis) of
>fun with his Macintosh!

I had fun with my Mac for a month or so, too. Then I tried to
do some work with it. Then I found out that I had *NOT* known
what I bought. I found out that all of Apple's promised were
lies. No decent software. No development tools. Nothing but
frustration.

If you're doing anything other than playing silly games with
your Mac, please let us know what. And how.

Seethings:

     After all those wonderful words of love for Mackintosh marketing,
I could only feel a lack of extreme sympathy, having shelled out $7K for
a Lisa I with the intent of buying LisaPascal to do some programming with...
Well, first there's the problem of you couldn't get LisaPascal from the
dealers, because Apple pretty much stopped distributing the Twiggy version,
in anticipation of the "upgrade" from two 800KB Twiggy drives to 1 400KB Sony.
Of course I'm still waiting, a year later, for my dealer to get a free
"upgrade" kit to upgrade my Lisa I to a Lisa II so I can buy a programming
language for the bitch. (are you listening, Apple?)
     On the other hand, I wouldn't trade my Lisa for anything but a
Sun workstation.

Of course Apple feels that the "final arbiter" is the bottom line
on the ledger books. Apple isn't a privately-owned company for the purpose

of helping out computer buffs, its a $1 bilion dollar publicly-traded
company that must recognize its obligations to its owners, the stock-holders.
Now, one can argue that the best business strategy would still be one that
encouraged long-term satisfaction with the Apple product line, but that
is strictly a business (ie maximize profit, long-term and/or short-term)
decision.

As to the prices you quote. Is anyone really paying those prices?
Here in the Chicago area, Macs are selling for around $1700 at the
cheapest places, and about $2300 or so gets you the basic Mac,
the printer, and a few software items like MacPaint and MacWrite.
This is at regular computer stores, and doesn't reflect the student discount
rate to the consortium (although the presence of a couple of such schhols
in the area may well exert some competitive price pressure). Anyone paying
full price for a Mac ought to seriously consider mail order, as a means to
save several hundred bucks.

Come on guys, be real. A 512KB dynamic board for ANY personal
computer is going to cost around $1000. Maybe a little less from
the discount joints, but still not cheap.

Msg #8072 on 09/03/84 @18:53 (62)
Subj: NEW SAFECOM DETAILS!, To: All
From: Bill Parker, Los Angeles, CA

Here is the new version of SAFECOM that I promised to post
on this board some time ago.

As you recall, SAFECOM is a program that encrypts and decrypts
text files. The purpose of this program is to allow us to
communicate on topics that some people (employers and others)
either do not want us to discuss or who want to monitor what we say.

I wrote the program and made it PUBLIC DOMAIN. It is liberally
sprinkled with comments that explain how it works. You should
have little trouble converting it to run on your computer.

There will be four levels of security: CONFIDENTIAL, SECRET,
TOP SECRET, and EYES ONLY. Each level of security has its own
password to encrypt and decrypt the files. You can get the
CONFIDENTIAL password from any original PMS Commando (I'll be
mailing them the password soon). I'll leave it up to their judgement
to decide who gets the CONFIDENTIAL password. To get the SECRET
password, you have to leave a message for me. If I know you, I'll
mail it to you. I haven't decided what TOP SECRET will be used for.
EYES ONLY is for direct communication between two people. You can
use it among yourselves any way you like. It's sort of like LOCX
on this system. Just agree with someone else what the password will
be.

To make this system universal, start out your encrypted messages

like this:

     SECURITY LEVEL: CONFIDENTIAL

     A1B300X99B...

The security level will tell the recepient what password to use to decode the message.

Some details on this version of SAFECOM: I tried to incorporate all the suggestions you sent me on previous versions. I removed the text editor. It was too crude, slow and buggy. Besides, everyone has a text editor anyway and there's no point in learning a new set of editing commands.

I used BASIC to express the algorithm because BASIC is so doggone universal. As soon as Borland comes out with a 6502 based $49.95 Turbo Pascal, you can bet things are gonna be different...

Send corrections, suggestions, and versions for different computers and languages to me, so that I can incorporate them into new versions. I'll give you full credit.

By the way, for those of you who noticed that I use a "~" symbol for a prompt on this system instead of the usual ":", it is for purposes like this...to upload long BASIC programs. I tried it before while using the ":" prompt and found that this system confused the ":" that separates BASIC statements with the system ":" symbol. As a result, some BASIC lines were truncated at the ":".

And if you're wondering how good the security is on SAFECOM, suffice it to say that I sent an encrypted version to one of those experts who writes letters to the editors on encryption and found that he was not able to solve it. SAFECOM doesn't use any of the standard "book" techniques that the experts are always quoting.

FP
MONICO

My favorite is the Lisa. Some 4 or 5 thousand bucks = half meg
memory and NO operating system! Of course for a measily grand
more you can have the other half meg of ram that the Lisa OS
takes and two hundred gets you the OS.

Mike Nelson
AT&T Bell Labs
ihuxf!cuda

PS My office mate has a Lisa she uses for graphics. It is one
of the best machines around for that. I just don't like the
way they market it.

Aw, come on; I can think of three or four others that top mine any day of the week. :-)

> Why don't you design your own fat mac and sell it for $1495.
> Then everyone would love you. But I know you're not going to.
> Must be because you're greedy.

Who said anything about $1495? All I'm asking for is $3000, a perfectly reasonable amount. Especially when one considers that Apple was selling Macs to dealers for $1650 when they first came out (the price has, I believe, dropped since then), and I really don't think they were losing money on that deal.

> Do you know what they call a business that sells things for less
> than they cost to make? BANKRUPT! Do you know how much 256K RAMs
> go for? $40 each. Do you know how much it costs my company to
> process a simple purchase order? > $50. Do you know what my company's
> required return on investment is? 2 to 1.

$30, since Apple is getting a discount for quantity. And I certainly don't expect any company to become a charity organization. I do, however, expect a certain amount of consideration for the people who supported the company and made its new product a commercial success. This, I think, is nothing more than good public relations.

> No one forced you to buy the Mac, so quit whining about how much it
> costs. If price really mattered you'd wait til it came down like
> calculators and IBM-PCs. Shut your face.

If one waited forever, one would never buy anything. Or what one bought would be obsolete. Agreed, no one forced me to buy my Mac, and I am not whining about the price I paid for it. My complaint is with the

surcharge Apple is forcing its customers to pay in order to make their product as useful as it should have been to begin with. It is perfectly obvious that Apple knew that 128K was inadequate, since all their spec sheets (as found in the $150 "Inside Macintosh" manual) refer to 512K Macs with double-sided drives, and that they misled their customers into thinking that the product they were buying was the real thing. What they should have done was, up-front, revealed this fact, charged their original customers a few hundred bucks more, and given them a coupon which would entitle them to free upgrade upon release of the Fat Mac. This, at least, would have let the buyer know what he was getting into.
Shut my face? Gosh, and not even a :-). I'm seriously hurt.

The follwoing was extracted from a local BBS and can serve
as a cp/m to dos transfer program.

The only catch is that the file is saved on the DOS disk with
a file identifier as binary. This however can be changed to
text with a sector editor program. Please read on. The file
can be downloaded and the pertinent part EXEC'd. Please
read on.

3D0G
BSAVE CPMXFER,A$6000,L$06F0
FP
```

On the CPMXFER file, the converted binary file should be marked text.
I don't have the source code, but the signature byte is written as a
04h (file type BIN) and not 00h (file type TEXT). If you can use some
sort of track/sector editor to change that byte in the catalog track,
that file will read as straight ASCII text.

...

While the prose in the original flame waxed a little excessive, I agree with the substance: Apple Computer Company is no longer the computer company for the rest of us.

As a longtime owner of an Apple][, I am very disappointed by the evolution of Apple's corporate philosophy. The early Apple believed in the masses. A general purpose machine was offered, and complete specs were given with the machine to ENCOURAGE independent work. Now, except for the][e, Apple is attempting to force a closed architecture upon the market, and the thought of telling the mere, average person what is going on inside sends shudders through the corporate structure. Detailed specs are sold at a hefty price. Substance in manuals has been replaced with Madison Ave, gee-whiz fluff. Software developers are "certified" because everyone knows John Q. Public can't program and shouldn't be encouraged to program.

[2 paragraphs of execessive prose deleted.]

What really takes the cake, is Apple's refusal to stand behind the consumer. First, there was the rev. A/ rev. B][e where the owner had to prove he needed the rev. B board. More recently,][c owners find the serial port is improperly designed, and Apple says "Prove you need it" before they will fix it. Now, the poorly conceived memory board of the Mac has finally proven to be inadequate, and the user must pay the price (and then some).

Having vented my wrath, I have a suggestion for Apple (who is on the NET, right?):
Form a review board of users to comment upon the design at various steps. Keep honest reviewers, and don't get rid of the strident voices. (As a public service, I reluctantly volunteer :=)

To the Apple apologists on the net: What Apple doesn't need now is a pat on the back. They have made several obvious mistakes both in design and support. Only a mass outcry and consumer boycott can penetrate their smugness.

A megabyte upgrade for a 5620 DMD terminal is $1300.
This is using the same 256K chips. I belive that if you
buy a new unit with the 1Meg option, it is only
$1000 extra.

Maybe Teletype should raise their prices to compete, eh?

Despite my previous flames about Apple Computer, the Company,
I am buying an Apple Computer][e to replace my aging
][. With the low price of][e's (<$700), I will stick
with my software library another year or so waiting
for the real Mac (color, etc.).

In the meantime, I want some disk storage. I mean 140k
is a drag, and with Prodos heirarchial directories almost
totally inadequate.

Your help is solicited. I want a high-density (:=) drive,300k or more.
I know of the Rana drives. Has anyone heard of anything else?
Please also tell me if the drive will read/write standard disks
(so I can share data with friends) and how easy it was to install
the drives under Prodos (if you have it).

Thanks.

My Apple motherboard has gotten quite dusty from
running without the top, and I suspect oxidation
has occurred to some of the socket and chip contacts.
I want to clean up all the contacts. Is it safe to
immerse the whole board with all chips, resistors,
capacitors, etc. in place? If so, what cleaning
agent is recommended? Is it likely to help?

Thanks.

This is a free country. If you think someone charges too
much for a product or service, DON'T BUY IT. The only
thing that makes it possible to charge anything at all
is CUSTOMERS. It is silly to charge $500 for a product
if you can sell all you can make for $1,000.

Why is it that any sleezy, slimy, dirty action by a corporation
is excused as the corporation's obligation to it's stockholders?
Are there no decent owners of stock in this country? Is it really
a businessman's ethic to be a greedy, moneygrubbing SOB at the
expense of his customers?

For some reason, I thought Apple was a little different. Note
the past tense.

I paid list price because when I got mine that's all there was.
If I had thought the $2400 machine I was buying would devaluate ~$1000
in six months, I can assure you that I would have waited.
But then if I and all the others who bought in the first 100
days had waited, all the rest of you would have been able to
pick up the Mac for $100 - and you would have said no, thank you.

Has anyone seen the Altered Finder that was created and submitted
by Dave Kliman?

This is the one with the Ghost Busters and Oscar the Grouch.

Not only does the Corvus Constellation allow you to hook up an Apple
and an IBM to the same hard disk. It also allows you to connect other
computers like TRS-80's, NEC's, etc...
With the Corvus OmniNet local area network and a 20 meg Corvus drive,
you can actually link up to 64 workstations to that single hard disk,
complete with password security for each user. I've had the chance to
use such a system, and it seems great. You can 'partition' the disk, such
that software in DOS, CP/M, Pascal, and other formats can occupy various
parts of the disk at the same time, so you are not limited to just one
operating system. The only thing that puts me off is the price, which can

be pretty steep, depending on the configuration.

If you didn't think that the Mac was going to drop $1000 from
the list price you are overly naive. You could have expected
it to drop 20% alone from list as soon as the distribution got
set up such that they were fairly available. Technology in this
industry marches fast and now Apple has a new computer that they
can productively sell for a comparable price as the old one. This
is the only way a company can stay in business in this market. DEC
will be in this boat if they don't come out with a newer computer
soon, they are getting walked all over by people with brand new
fast and cheap minis that beat the shit out of the 780 family.

What would you have had Apple do? Inflate the price of their new
product so it would devalue the existing products selling price?

-Ron

To Randy Menna:

I tried repling by mail to you, but twice it wouldn't ,make it.

I have a pascal compiler for the Apple ///. I would be willing to
part with it for a small percentage of the original cost. The only
catch is that the manuals have been sold. (My Apple /// was stolen
about a year ago, and I posted a for sale message for software and
manuals a few months ago to the net.) I still have the compiler with
the original disks.

If you are interested, make me an offer.

Mike Robins

It was interesting to see the comments posted by Mike Conley and Mike Ward
re: the 512 Mac upgrade. Herein I'd like to exaplain a few things they
missed, and so here I go:

>> = Mike Conley (...unm-cvax!cs4911ay)
|| = Mike Ward (...hao!ward)

>> ... When the Mac was fiist announced, the
>> price was $1995...

I never saw $1995 as an "announced" price. I did see it as a "predicted"
price, but that wasn't Apple talking.

>> ... Then, when it
>> finally saw the light of day, filtered through display windows, the price
>> had somehow escalated to $2495 -- for the bare-bones system, of course.

Bare bones? I don't know what most people consider "bare bones", but I
doubt that a computer equipped with the equivalent of a monitor, a disk
drive, serial ports, extra disk port, a mouse and $200 worth of software
fits that description.

>> ... We all sprung our $2995 for the Mac and the printer, and

>> shortly afterwards realized that the thing was absolutely useless without
>> the second disk drive.

I realized that after playing with one in the store for about fifteen minutes.
That's one of the reasons that I didn't buy one when it first came out. I
guess what happened to you is what happens when someone doesn't play around
extensively with something before he buys it.

>> ...a workable system sells for $4485.

Huh? $4485? Where did THAT figure come from? Right now a 128K Mac with
a printer can be had for $2395, plus the $995 upgrade, that's about $3400.
What's the extra $1100 for?

>> ... They should properly be giving the damn thing [512K upgrade] away
>> for the price of labor, since the price hike in the beginning covers
>> what the upgrade should be costing now.

Hah! There never was a "price hike", just a lot of surprised people when
the figure the computer magazines gave turned out to be $500 low. As for
giving it away for labor cost, why should Apple give away two 256K chips
and all the hardware changes that come with the higher port speeds? Apple
has a responsiblity to its stockholders as well as its customers.

|| ... Apple has dropped the price (effective someday) by $300.

"Someday" is now. List on a 128K mac is now $2195.

|| ...before the Mac, the only decent thing they [Apple]
|| produced was little more than a toy, and that they have
|| produced failure after failure - if the Mac had not sold well
|| that company would now be worth zip!

HUH? Accepting for the moment (even though I don't) that the //e is
"little more than a toy", Apple's only really significant failure was
the Apple ///. The Lisa actually sold as many as Apple predicted, just
not as many as they had hoped. Had Mac not taken off, the increased
popularity of the //e after the PCjr came out would assuredly kept the
company's head above water, assuming it was in any real danger in the
first place.

|| ...Is anybody going to be stupid enough to buy a Fat Mac at $3100?

Probably a lot more people than those who were stupid enough to buy
a computer for $2500 on the basis of a neat commercial and lots of
promises :-).

Lessons Learned:

> Don't buy a computer just because it is "cute" or even
> "insanely great". Buy it because you know it can do
> everything (or at least most everything) you want it to
> do for the forseeable future. Don't buy a computer without

> the software you need. If the salesman says "someday", wait
> for "someday", or if you can't, get another machine. And
> last but never least, don't buy a computer you want to do
> serious work on until it has been on the market for at least
> nine months. If you buy before that, be prepared for broken
> promises and some surprises. Just think, if the two Mikes
> had waited until now to get their Macs, they could have had
> a much better system for only $700 more. I doubt that they
> would have been any worse off for the time without the Macs.

Come on guys, if you don't want to get shafted, don't bend over.

.rne.

>What would you have had Apple do? Inflate the price of their new
>product so it would devalue the existing products selling price?

I would have Apple recognize that those of who bought early,
at list price, were a little freindlier than the Pournelles who
waited. I would have Apple give us a break on the price of the
upgrade.

I agree that I was just incredibly naive to think that Apple
was any different than any other money-grubbing corporation.
I hope Apple realizes what they've given away when the Japanese
drive them out of business.

I am not associated with Apple, but the childish flaming at Apple for
charging a FAIR price for the FAT MAC requires a defense.

TESTED 64k DRAMs are under $3.50 each in volume ... TESTED 256k DRAMS are
still floating around or above $30.00 each and the price market COULD easily
suffer the increases caused by heavy demand as people switch from 64 to 256
parts .... just as the prices on 64k parts soared in 1981 as people switched
from 16k parts.

simple math is 18*$30 = $540. Dealers discounts are typically %40 off list
so an expected dealer can recieve the upgrade at about $999*0.6 = $600.

The remaining $60 plus or minus $50 is not enough to cover the paper work
and testing/restocking of old digital boards ... which CAN NOT be simply stuffed
into a new machine (used parts in new equip is against the law I understand).
Apple is going to end up with a lifetime supply of spares on the 128k mac
boards.

In realistic terms Apple is probably EATing $300-500 dollars by offering the upgrade at near componet costs ... and may eat a lot more if the price on 256k parts soars back above $40.00 a part.

The upgrade price is the nearest thing to a free lunch I have seen ... in an industry where multiples of x2.5 to x3.5 are min list prices above costs .... thus a fair price for the upgrade today would be above $30 * 18 * 3 = $1,620.00 plus installation labor and a restocking charge (and testing) for the old board ... a real value of closer to $2,000 even.

Apple is both VERY kind to its installed base ... and praying that the prices of the rams drop before it looses it's shirt on both the upgrade and the NEW price for the 512k MAC.

Go try to by 256k parts on the salvage/hobby market ... about $50 a chip including tax/shipping is common for untested parts. 18 * $50 = $900 ... take a batch of those and do your own upgrade ... hope it works ...

John Bass

Too the flamers and cryers ...

I don't own a MAC ... but borrow one regularly to do REAL work using beta copies of MacPlan and MacDraw over the last weeks ... I have few gripes about the product.

For a machine that has only been out a few months in volume everything seems to be doing well ... Dozens of packages are hiting the market.

The early IBM PC owners (and those of any other machine I can think of) went thru worse during the first 12 months of product introduction ...

Apple told no lies from what I can tell from having watched the product from before it's release .... we all knew from the first day that the other products from apple were months out from First Customer Ship.

As for the whine about price reductions ... WHAT THE &*^%*&^% are you (*&^(*&^%$ bitching about .... prices coming down from intial introduction is a FACT OF LIFE. If you want to talk of depreciation look at the sale price differential of a new car, mobile home, stero ... to value 12 months after introduction ... nothings changed in this world.
AND Apple ramped production fast enough not to have the SHORTAGE problems found for 6-24 months typical of IBM and DEC.

Cry if you wish ... but you are so spoiled as to not know what (troubles) you have missed. Whats the matter ... doesn't your mother love you?

It's a shame sometimes that the freedom of speech can be used to so widely bad mouth a supplier who is bending over backward to give us a better product than the IBM PC (its clones) and simular outdated 1970's products that are 1980's trash.

In reply to the question regarding the status of the card to allow those of us with II+ machines to upgrade to IIe's:

It doesn't look like the Woz is putting in too many late nights worrying about it. Last weekend he was here in Detroit and spent an hour on the radio, then four more hours at the InaComp Computer main store in Troy. Was he talking to the local techies about the nuances of the II+/IIe conversion board? Not a chance -- he was hyping "designer Apples" personally signed by Woz (the designer, get it). The whole thing was advertised all week on the radio. Disgusting.

Where have all the heros gone...

I suspect the marketing style of Apple was a result of the success
of a boring machine, the IBM PC. At least Apple did not produce another
PC compatible. The macintosh is a good bit-mapped graphics show-piece.
It is not easy to get that much code working that reliably.

I think it is a mistake to buy a nice machine and a bunch of promises.
If you want a machine to help you get some work done, there are probably
other people already doing similar work with an old machine with
fulfilled promises.

The exciting thing about the Macintosh is that people are seriously thinking
how to build systems with good user interfaces and which are well
integrated as well as modular.
I think we will see alot of nice bit-mapped graphics machines around
in the next few years. What will be the standard bit-mapped operating system?
Who will define it? A big corperation or someone working in their garage?
How can we write portable bit-mapped software?
In the meantime, the Mac. is not a bad terminal to my favourite
operating system and it is food for thought. Can anyone figure out
how their Icons can be non-rectangular and how to do a non XOR mouse?
A good exercise in bit-map arithmetic.

The above views are my own.

I don't have an interest in Apple either but did want to say that
as a design engineer in a division which makes single board microprocessor
products, John Bass's numbers look reasonable to me. I know what we
pay for 256K rams and what our required markup to pay for overhead is
and actually, we'd charge a lot more than Apple is asking for the upgrade.

Does anyone remember the HP-35 and how it cost $395. HP dropped the
price on it and didn't offer discounted upgrades to anyone, I recall.

What's all this noise about old Macs losing their value? Unless you're planning to sell the thing tomorrow, depreciation is only a paper loss designed to keep accountants busy. You want to see depreciation? Buy a new car. It will depreciate 10-20% the first day you own it.

The price was bound to come down; how could it not? Us early birds (I got mine in April) paid for product development costs, tooling costs, and a high demand/supply ratio. So what did we get in return? Six months of machine time, that's what. Was it worth it? Maybe yes, maybe no. So far, my Mac has helped me generate $1500 in consulting income (using MS-Basic of all things! I feel so cheap...)

Every Mac owner knew the price would come down and memory would increase. Everyone who writes software knows that product release dates are fairy tales. If you paid the premium for an early machine and couldn't use it, then I'm sorry for you. But I think everyone knew what they were getting into.

John Bass has finally hit it right. If you think Apple is making any
money on the upgrade, you are sadly mistaken. I wish we were -- I own
stock. If you want to complain to someone, try the dealer you bought
your Mac from. They are the only ones making money on the upgrade.

Actually, you might try Japan inc. as well, I believe they are making
money on this as well.

Sorry to disappoint you all, but you'll have to think of something else
to flame at Apple for. Think hard, something will come to you.

These are *my* views and they do not represent those of my employer.

When I placed my order for a Lisa 2/10 at the tail end of June,
Apple developer support said, "We're not promising, but Lisa 2/10's
should be out in mid-September." In mid-August, I called, and they
said, "Definitely mid-September." So mid-September rolled around,
and now they say, "Sorry, looks like January. But that's firm."

WHAT GIVES????? Apple, I know you are out there. You want software
for the Mac, yet you cannot produce the development system you

recommend! I keep hearing that you can't get a part (which part,
you won't say, at least to me). If I were you, I think I'd
send Mr. Jobs, or Woz, or somebody, to GET THE PARTS.

Patiently twiddling my thumbs.....

I worked at a highly successful computer store for about 6 weeks this
summer (a mistake I'll never make again -- I can't stand working in sales)
that had a national account agreement with Apple. Hasn't anybody heard of
the Apple //c? When I was still there, it was way outselling the Mac.
But it's being marketed at the non-business, non-computer-hacker crowd,
so maybe you just didn't think about it...

>   I just received news concerning the Fat Mac, of which we have all
>heard so much: the Macintosh, with 512K. It has been released and is
>on its way, delivery date approximately three weeks (or thereabouts;
>delivery dates haven't been Apple's strong point lately).
>
>   I also received news about its price.
>
>   Brace yourselves.
>
> $995. Yes, you read right: that's nine hundred ninety-five big ones,
>to be removed deftly from your wallet and placed just as deftly into theirs.
>All that on top of the $2495 (or $2195, if you happened to get it in one
>of the recent sales that have started to spring up here and there) which all
>us Macfans have already shelled out.

    Question: is the item worth $995? If it isn't few if any
persons will pay it. If it is, what's the gripe?

>   [Background: My friends and I who purchased Macs are not the
>businessmen-types that the Mac seems to be aimed at. We are but simple
>college students, not fortunate enough (or rich enough, as the case may be)
>to attend one of the schools in the Apple University Consortium, and get
>our Macs for dirt cheap.

    Ok, that's the gripe. This thing is priced at its presumed value,
rather than what those who would like to have one can afford.

>   Well, they sure got it to us, all right. For the measly sum of
>damn near a thousand bucks extra, we plebes can get ourselves the system
>that should have come out in the first place. So now Apple has us all
>over a barrel. We all sprung our $2995 for the Mac and the printer, and
>shortly afterwards realized that the thing was absolutely useless without
>the second disk drive. So, another $495 went down the drain. Next comes
>the realization that with the basic 128K, the user is left with too little
>memory to accomplish anything significant. So, another $995 down the tubes.
>Thus Steve Jobs' vision of the computer that anyone can use has become the

>computer that no one can afford, because a workable system sells for $4485.
>What a bargain!

The question remains: what was the basic Mac system worth? If is wasn't worth the $2995 it cost, why did anyone buy it? If it was, what's the gripe?

$995 for 384K of memory doesn't strike me as exorbitant.

> Looks like Steve & Co. are standing by to rake in the big bucks; The
>Rest of Us can all bend over and grab our ankles. It's coming in dry, folks;
>no Vaseline on this one.

>...Apple has shown that, in the end, they're not that much
>different from any other computer company, that they don't really give a
>damn about the end-user, and that the final arbiter is, as we all suspected
>but hoped against hope was not true, the bottom line on the ledger books.

Looks to me a bit like the old "I want it, I can't afford it, therefore those who sell it at the price I can't afford are money-grubbing hogs" line. I am sure of one thing; the author of this complaint will eventually depend on some business institution for his bread and butter (he does now, but perhaps doesn't realize it). If that company prices its products higher than their worth (to the market that buys them), they won't sell, and someone will come up with the same thing at a better price and capture the market. On the other hand, if it sells at prices that do not respect that "bottom line", they won't exist; and this person will find his employer bankrupt.

Businesses (including Apple) exist ONLY because they are able to market a product at a price that satisfies that market and produces revenues sufficient to pay its bills, its employees and management, and produces with some regularity a profit for the owners of the business. If you want to get something for less than it costs to produce it, who are you expecting to take up the loss, to subsidize you?

If you believe, as you indicated, that the price will drop, then perhaps the thing to do is to wait until that time. Until then, I can't see any basis for criticizing Apple.

[Go Macintosh!]

Its nice to see a few people agree with me, but for those of you who are
still torqued about the value of your 128K Mac going down the tubes, look
on the bright side.   At least you didn't but an IBM-PC/xt the day before
they announced the price cuts and the new PC/at. Those folks really took
a bath. And I still say we're getting a decent price for more memory, better
performance, et al.
(By the way, anyone got $995 I can borrow for my Macintosh's upgrade? ;-)

"My opinion STILL may not reflect that of New York University, or anyone
else in particular..."

> Why is it that any sleezy, (sic) slimy, dirty action by a corporation is >excused as the corporation's obligation to it's stockholders? Are there no >decent owners of stock in this country? Is it really a businessman's ethic to >be a greedy, moneygrubbing SOB at the expense of his customers?

What do you mean by sleazy? If you mean that you think everyone in those glass towers is another J. R. Ewing, you're entertaining a myth. If you mean that the management won't sell something unless the sale is profitable then that is not sleazy, it's inevitable, and desirable.

There is a word for businesses that are not run that way: bankrupt.

> For some reason, I thought Apple was a little different. Note the past >tense.

No, it follows the same rules. You can tell because they are still in business.

> I paid list price because when I got mine that's all there was. If I had >thought the $2400 machine I was buying would devaluate ~$1000 in six months, I >can assure you that I would have waited. But then if I and all the others who >bought in the first 100 days had waited, all the rest of you would have been >able to pick up the Mac for $100 - and you would have said no, thank you.

Most new items are placed on the market at a price gauged by the manage-ment to be appropriate. When sales figures arrive that show the decision was inappropriate, adjustments are made. Sure it's annoying to see the sale price drop after you've paid the higher price, but consider this: if the price had not dropped, would you now be any richer? What would the cost be? You must have felt that the item was worth what you paid for it, otherwise you'd not have made the purchase. Has the item changed?

Neither Apple nor the company you work for can exist without engaging in profitable enterprise. Your paycheck attests to that. If it were not for "moneygrubbers", you'd be out of work.

I am looking for the source to a 6502 system monitor for a small
controller project I am working on. Since the hardware will be
special purpose, I am willing to heavily modify the source file.

I would like to see the following features:

     Memory examine/deposit
     Trace of program flow
     Breakpoints
     Register examine/modify
     Downloading of Intel hex format object code
     Jump to address

Since I am new to this newsgroup, I apologize if this information
has been posted already. If I can't find one, I'll have to write
it - so any help is appreciated. Please reply to me and I'll send
a summary (or a listing) to anyone who requests it.

               Thanks in advance,
               Rick Walker (...!hplabs!hplabsb!walker)

Maybe I'm showing my ignorance, but I thought the Mac didn't have
parity. This makes it $30 x 16 chips, not 18 chips. Not a big diff.

Considering the volumes they're buying in (hopefully they are not
paying $30/chip like the rest of us), Apple might not LOSE money on
the deal but they sure aren't going to make much.

And if you think issues of upgrades and dropped prices and old versus
new customers and dealers are easy to deal with, read:

     Hypergrowth: The Rise and Fall of Osborne Computer Corporation
     by: Adam Osborne and John Dvorak

     (Berkeley: Idthekkathan Publishing Co. He had to print it
      himself because it's so revealing that major publishers would
      not print it for fear of legal action.)

     ISBN 0-918347-00-9.

Costs about $30 and worth it, if you are in a growth company, invested
in one, or thinking about it.

As an addition to the message on net.startrek about little things in
Star Trek III, here's something I noticed:

> In the scene where the Genesis information is transmitted
> from the pirate ship to the Klingon Bird of Prey, the sound
> effect for the "data cube" device is that of an Apple][
> booting up. (The feep, and then the drive recalibrating.)

Just a li'l trivia to brighten your otherwise interesting lives.

[parity error 02]

Last fall I went out on a limb and predicted that it was foolish for
any college to depend on MACs in 1984-85 for large numbers
of college students. I predicted that the MAC would not come out
soon enough, that reliable software would not be adequately available
for this semester, and that colleges making the early purchases of
MACs in quantity would find they had a lot of white elephants on their
hands for a while.

Apple has clearly done a much better job than I expected bringing out
a reliable MAC. Some good software packages at least are available.
Now I would appreciate hearing from people at schools (like Dartmouth)
that counted on the MAC to serve many students.

I will be glad to summarize private responses to the net.
How do you like the MAC? What are you able to do with it?
Do you know many students who are using MACs regularly in their work?
Do you wish your college had emphasized a different machine? If so,
which one?

If you write to me, please indicate your the degree of computer
literacy. It seems to me from information I have collected so far that
some of the happiest MAC users are computer jockeys with access to
as-yet-unreleased MAC software.

Come on. Apple is a company that may soon fold, so quit crying
about how Apple is shafting America.
The thing with Apple is that the managers there may not be
producing macintosh's at the optimal point, ie. where
the rate of return on investment equals the market determined
rate of interest.

(Apple lovers please send Flames to

Apple computer company is one of the few innovative computer
companies in America. At least it doesn't make up some inferior
computer like and try to sell it at exorbitant prices, like some
well known PC manufacturer, and let's face it...
The mac is one of the most powerful PC's on the market today,
certainly superior to a 4.77 (haha) mhz HAL PC (and all other
HAL imitations).

A content Apple owner. (And macintosh's are cheap!!!!)

[]

At his request, I have posted a copy of Dave Kliman's Altered
Finder in net.sources.

This will give your Macintosh an interesting new look.

It is in tohex format.

The easiest way to install it is to make it am application, then
hold down option and command while double-clicking it. Then,
you can delete "finder" and rename the altered finder "finder".

Lines: 28

Request for hookup information between an Apple Communications Card
and a Volksmodem.

I recently purchased both a Volksmodem and an Apple Comm Card.
I wished to use this combination as a low cost entry into "telecomputing."
However I have been unsuccessful in my attempts to get this pair to
work together. The Apple Comm Card not actually a true Apple Computer
product but rather a look-a-like (This may be the problem, but ProDOS
does recognize it as a Communications Card from the slot contents command).
I have been trying to understand RS-232 and what signals are
produced and required by both the Volskmodem and the Comm Card. I have tried
several connections, which I considered reasonable, but to no avail. I
have even consulted M. D. Seyer's book "RS-232 Made Easy" with no luck.
I have been able to use the Volksmodem with an Apple Super Serial Card
(not mine), which provides a few more signals than the Comm Card, so I
know the Volksmodem does work.
If anyone out there has gotten this combination to work or has
any constructive ideas on the subject I would be happy to hear from you.
I will readily admit that I do not have a complete comprehension of RS-232
and I may be missing something basic in the connections. Any help will be
appreciated and the results will be posted for those of you who
may be interested in the outcome.
Send electronic mail to the address in the header (mhuxh!slimw).

Thanks in advance,

Phil Wittman

IF IT AIN'T BROKE, DON'T FIX IT! Think about it: If a machine or board
is working properly, nothing you do to it is likely to improve the
situation. So don't risk immersion in solvents or physical manipulation
to clean contacts. Even gentle manpulation can break component leads,
and many solvents leave behind worse deposits than they remove.

However, dust and various airborn grime definitely can be deleterious to
boards. First, dirt can attract or retain moisture, leading to
corrosion as well as current leakage paths. Second, and more important,
accumulated dust can significantly reduce air circulation around and
beneath chips, thereby reducing cooling, thereby increasing operating
temperature, thereby increasing the liklihood of component failure.

So it can pay to clean grime from boards, but only if it can be done
nonobtrusively. The best idea is to vacuum, or better, *blow*, loose
dust from boards, being careful not to touch components with the vacuum
cleaner. Of course, anytime you use a vacuum cleaner you are raising
are making airborn numerous microscopic particles, so power off all
rotating media and either cover removable magnetic media, or better,
remove them from the room.

Yes! The new Softerm 2 uses a 3-button keyboard expander to provide
extended terminal functions like keyboard macros, accessing file
transfer menus, special characters and PF keys, etc. This reduces the
clutter of control-whatever-it-is usually found with other terminal
emulation packages. It also emulates a sizeable number of terminals.

Some emulations require 64K RAM (Televideo 950, HP 2622A, Honeywell VIP7801)
Speeds are from 50 to 9600 baud, depending on your communications
interfaces. It is also one of the relatively few programs that support
the Novation Apple-Cat][modem at 1200 baud. It reads DOS, Pascal
and CP/M disk without additional hardware or software. File transfer
protocols included are character, XMODEM/XMODEM7 and Softrans, Softerm's
own protocol. A FORTRAN77 source code is also included for implementing
Softrans on the host machine. Monthly updates are available from Softerm's
dialup computer in Tenessee.

.

I can hardly believe all you moaners and groaners that bought a "cute" little Macintosh and now you feel shafted. I think Michael Ward summed it up very nicely: "You've been stupid enough to cough up the bucks so far..."

Anyone who buys a computer and isn't familiar with the pitfalls involved should ask someone who is for help. Anyone who is familiar will tell you never to buy a new product till it's been out there for 6 months and you can see what it will do. Falling prices along with semi-annual upgrades are almost constants in the micro business. I have yet to buy anything, from a plain dumb terminal to a whole computer system, that hasn't dropped in price within a few months. Even after waiting 6 months to see how it stands up on the market.

I was slobbering over the Macs in the store when they first came out, but after 6 months I wasn't hungry anymore. I got a box of crayons at home if I want to draw pictures (they'll do colors!). You guys think you got the shaft. I think you were bending over with your cheeks spread when you bought your 128K Mac.

Jerry

[] Eat this square box, and you'll get indigestion...

> This is a free country. If you think someone charges too
> much for a product or service, DON'T BUY IT. The only
> thing that makes it possible to charge anything at all
> is CUSTOMERS. It is silly to charge $500 for a product
> if you can sell all you can make for $1,000.

I agree that this is a free country, and that the ultimate choice rests
with the purchaser, but didn't someone at Apple have the ambition to
make the computer for the Rest of Them ?? (I wouldn't think that anyone
on the net could be included in the 'Rest of Us' part of their Ad.)

Apple Computer may be selling all they can make right now, (since they
have just introduced a new product,) but the really important thing
to Apple will be the sales of the Mac in two to five years. The durability
of a micro is influenced more by the NUMBERS of units out there than by
the quality or friendliness of the product.
(Have you ever used a Commodore 64 ?? There must be zillions of those
suckers around by now. If you have used a C64, you should understand what
I mean by 'friendliness' or lack thereof.)

How much *GOOD* software will be written for a Mac if the developers have
to buy a Lisa, (see some of the other articles for a few flames about those)
and cannot get software or hardware for a reasonable price; and then after
all that, their market is ~10% of the size of the IBM PC market. If you
were a developer, which would you buy:
     a $5000 Mac with nothing, plus an $8000 Lisa with very little;
or
     an $8000 IBM PC/XT system, with available software for *ANY*
     development task ?
                    (* Prices approx. *)
I would like to see the Macintosh succeed, and make another standard for
IBM, et.al to copy. But I don't see it happening now that IBM and the
cloners have been dropping their prices to realistic levels for the
performance they deliver; (and what of the IBM AT? upward compatibility ??
Where is Apple's successor to the Lisa ?)

That's almost enough for now. Just so there's no misunderstanding of my
micro-preference, I own an IBM PC, but I prefer the Macintosh *DESIGN*,
and abhor the *MARKETING*. I guess you can't please everyone.

Oh, how true! My machine's keyboard began, over a period of time, to become flaky - it'd transmit F when I pressed S, S for F, 4 for 2, 2 for 4, and so on. The failures occurred more frequently when the weather was warm and humid. I figured the encoder chip was bad and replaced it, with TEMPORARY success. The new part began to do the same thing. I checked the power and everything else I could think of, and finally in desperation applied a solvent cleaner after blowing at the thing for a while with my lungs. The keyboard STOPPED working altogether. I could see that it was covered with soaked-down dust kittens and other gunk, and so my last great act of defiance was to take a toothbrush to it, dislodging all that yecch, and lo and behold, I have a working keyboard again, with a spare encoder chip for use when the one in use DOES finally die. I don't recommend this course of action, but it is clear that a) solvents can do more harm than good, and b) dust, etc., can cause serious problems to an ordinary PC board.

Cheers,
Dick Binder   (The Stainless Steel Rat)

[chew on this gibberish for awhile]

Has anyone noticed that the size of programs always expand to fill the available memory? Does anyone out there really think that a 128k MAC will be useful 6 months from now?

What else will we get with a 512k MAC except bigger programs that take longer to load? Is there any truth to rumors of MULTI-TASKING MAC software?

And what about batch processing of command lists? What new USEFUL features have we really gotten? What USEFUL features have we lost in exchange for screen sex?

This memory problem really irks me. The IBM has this problem too, and in spades. Remember the good old days when Wordstar was considered a BIG program in 24k? Now programmers can afford to use terribly inefficient compilers and write code in the quick-and-dirty. Is this good? Next we all get multi-tasking systems that put a premium on tight and re-entrant code so it dosen't hog the whole machine. Either that, or move to virtual memory type operating systems and just swap the hell out of everything.

And while I'm at it, does anyone out there really thing that the wave of 16 bit processors really gave us higher performance? I think all it gave us was more addressing space. It STILL takes 2 bus transfers to load an address into the processor. And SURE we went to higher clock rates on processors, but with the new EXPANDED instruction sets instructions take 4 times (or more) as many clock cycles to execute! Instruction sets are larger, so instruction codes are bigger, and so

are instructions. OBOY now we have more instruction fetch cycles per
instruction and the code is larger. What used to run in 64k now runs
in 256k JUST SO WE COULD HAVE MORE ADDRESSING RANGE! Is this progress?
Disk space just got smaller. That's ok, you have a winchester?

I think the only computer 'for the rest of us' is still an
ATARI or COMMODORE.

Don't get me wrong, I like screen sex, but there's more to life than
just sex.

but sex SELLS!

This is what I have on paper so far. Anyone tried something like this
yet?

-----RS422 (+5v line driver/receiver)-----

```
MAC    function     breadboard       VICMODEM     function
1,3   ground        ground           1,12,A,N     ground
2     +5v           pwr to ic         ------
4      TXD+ -->     3.3k pullup -->     M        data to modem
5      TXD-          ----               ----
6    filtered +12v   ----                10       modem power
7  carrier detect<- LS04-8, 6 to 9, 5 to H,K     carrier detect
```

```
8      RXD+          ----               ----
9      RXD- <-- LS04-4 &1k res., 3 to <- B,C     data from modem

           back of mac
           -------------
           \5 4 3 2 1 /
            \9 8 7 6 /
             --------
```

The Macintosh book (red cover) seems to say you can run the RS422 lines
open ended like this. They talk about doing it with the imagewriter.
I have yet to hook this up and try it. Also, I want to make sure the
"back of mac" shows the pinouts in the right place.

From what I have heard and read, there is NO difference between the 128K
boards and the 512K boards except for the type of RAM chips installed.
In other words, the boards were designed to take either type of chip from
the beginning (or sometime around then). Apple wanted the Mac to be a
closed system in terms of hardware, and that appears to be their reasoning
in not using sockets for the RAM chips.

hey! _R_E_A_L PDP-8s only had 4k-words, and ran FOCAL (FOrmula CALculator),

a nice little interactive language. If your program was too big,
you could throw away the trig functions! How do you run a screen editor
on an asr33 teletype? Storing your programs was no problem, just roll up
the paper tape and pop it in a 35mm film can. Those were the days....

<net.news.bug>
Yes, it's time once again to take a straw vote on adding net.micro.mac to
the newsgroup list. When net.micro.apple has about 50% (apple][,//e,//c)
and 50% (mac,lisa) articles, I for one think a new group is warranted. To
keep net.micro.apple from turning into 10% (apple][,//e,//c), 10% (mac,lisa),
and 80% (yes! to net.micro.mac, no! to net.micro.mac), please MAIL, don't
POST your replies (along with any suggestions, such as calling it something
other than net.micro.mac) to me, and I will summarize to the net in a couple
of weeks or so. Send to ...ihnp4!umn-cs!digi-g!brian

According to this week's (Oct. 1, p.83) *Computerworld*, Apple is buying out
the *special election edition* of Newsweek, which is not necessarily the
same as the November 8th edition. This would answer Dr. Pournelle's
objections about displacing regular advertisers.

My question is, what on earth can Apple DO with that much space? Dearly
as I love the Mac, I'd rather use it than read about it. Its qualities
are easier to convey by demonstration than by description.

Perhaps they'll be advertising 'the complete Apple line' rather than simply
the Mac.

(* a feature is a bug in a three-piece suit *)

In hopes of breaking out of the 512K Mac/I-hate-Apple/etc loop how about a new topic?

Apple's Lisa (and hopefully Mac) are certainly powerful enough to run a version of UNIX. (Even IBM PC's run UNIX... :-)

A Lisa (or Mac) running a version of UNIX which took advantage of all the nice hardware (mouse, bit-map) would seem to be a real nice workstation at a moderate price. What do those of you with such a setup think of it? I've heard from the people at The Santa Cruz Operation (they did a Xenix port to the Lisa) and they really like using UNIX on the Lisa (but then again they did the port). I've also heard that UniPress's System V for the Lisa is slow and not very good in terms of support for Lisa's hardware.

I don't own a Lisa (or Mac) yet but I'm thinking about getting one to replace my trusty RS Color Computer (running OS9, is there an OS9 for Mac or Lisa?). Any and all suggestions and comments would be appreciated. You can mail them to me for summerization or simply post them.

Let's look at some interesting ways to USE what Apple has produced aside from whatever feeling you may have about the pricing/marketing/fairness of their hardware releases.

I am looking for public domain software for an Apple 2+.
1) A plotting routine which will accept as input empirical
data, scale it, fit a curve thru it, and display it.
2) Digital filter routines

Can anyone steer me to either of these?

The story seems to be that MacTerminal is trying to keep a consistent copy
of the screen on the disk so that if the power fails, things look the same
as when you left when you restart. I find the buzz annoying too---I'd
suggest you call or write Apple to suggest that it at least be made a setup
option.

I just received the Manx C compiler for Mac. I have several problems with it,
two of them in the tutorial. I think I may have a bad system disk. Does
anyone out there have this product working?
     Here are some of the problems I am having:
1. In the /include directory, cat errno.h returns nothing, so does
cat <errno.h. Typing in hello.c using cat works, as does cat hello.c.
2. Hello.c compiles and assembles fine, however when I link it with

ln hello.o -lc I get the error sys:lib/c.lib Not an object file! Also running libutil -ot c.lib gives a header error.
3. When I start the Z editor nothing happens and I have to re-boot.
     Any help or correspondence from other Manx C guinea pigs welcome. Is Manx on this net?

     For the observers out there I will say that this looks like a good package, if I can get it working. There are function calls for much of the Inside Mac stuff (lots of routines, *I* don't know if they have all of them or not), a Unix-like shell development environment, an editor (or so they say, see above), several utilities. A simple terminal program and a desk accessory are included in source and binary and there are sources for many of the utilities and libraries. Again, assuming there is more to it than the documentation, this looks like a fairly complete package. There is a phone # for support, however it is manned 1-6 Eastern time which is not so convenient for West Coast folks without large PacBell budgets.

I forgot to say that I get "error reading disk, 0" when I do cp 1: 2: to copy the system disk. I first tried to copy it using diskutil, could this have mangled the disk? Also, cat errno.h works on the original disk but Z bombs to a standard bomb box. I am reluctant to try hello.c on the distribution disk which I like to keep write-protected as much as possible...

Does anyone have any insights on what's the best program language software available or soon to be available for the Mac. What I've heard about so far is:

1. Modula II -a superset of pascal. I've heard the least expensive versions aren't that good.

2. Forth - 3 levels with rapidly escalated prices as you progress. A fast executing language, the dictionary is neat, the way the stack handles arithmentic is not so neat.

3. C -I hear it has bugs in the released version. For around $2k (gasp!) you can buy a cross-assembler version to run on your mainframe. Q.- Since we have Unix 4.2 and a C compilor at work anyway, why isn't there a cheaper, better way to go on this? It seems like a terminal emulator program with download and some primitive vax to Mac toolkit algorithums would be all you'd need. I guess they wouldn't make enough money that way.

4. Fortran 77 - This also runs on our vax but I see no vax support on that advertisement.

5. Pascal - Nice, clean structured language but less I/O capabilities than Modula II. Probably slower execution speed that Forth.

6. Mbasic - Now there's a language everybody understands. Unfortanately, it's slow and I unless you get something like waterloo basic, you get tired of using go to's and yearn for something more structured after awhile. Cbasic is fast but I don't think they have that for the Mac yet.

7. Let's see, what have I missed. I haven't seen 68000 assembly language available for the single 128k Mac yet. The only answer I got as to why was that nobody wants to write programs that are limited to 64k. My answer was "well, why don't you let us at least TRY." If that was the only reason, we should see it come out for the 512k version eventually.

8. What decides which is the "best" programmming language for the Mac?
My thoughts- price, availability, no bugs, transportability, ease to
learn it, execution speed, development time, ease of understanding to
other programmers, program structure, I/O capability, and documentation
either built into the SW or in the manuals.

(Line eater fodder)
     A while back, I posted an article requesting info on compilers for
the Apple II series. Due to the fact that I have just recently moved and
my files have not yet caught up to me and that there was recently another
article on Aztec C, which was the only compiler I got replies on, I will
not summarize the replies I got unless someone requests it. Thank you
all for dropping me the info.

Subject: Manx C & a query

We just got MANX C for our Macintosh this week. A two sentence review is that the documentation is excellent, and the software really does what the documents say it does, except for a couple of bugs. And the people at Manx seem to be right on top of things bug wise and are mailing out fixed copies to people at lightning speeds.

I have just started reading this so forgive me if this ground has already been covered, but does there exist out there in some obtainable form, a RAM disk driver for the 512k Macintosh? Most of that 512k seems to be unused. For example it seems like the Manx SHELL reloads itself from disk every time control returns from a program. If you could make a 256k ram disk then you would probably get all the extra memory speedups in the programs that are pushing the 128k limit, and get some use out of the other 256k as well.

I have a copy of the Macintosh Developers Newsletter. The contents the letter were much less interesting and newsworthy for me than the actual newsletter itself. It was "Printed by MacWrite on an insanely great, unannounced Apple printer." I am no expert on print quality, but to my untrained eyes, the type looks as good as any typesetter could do.

Thought somebody might be interested,
Michael Toy

> the beginning (or sometime around then).

Apple now says that there were four versions of the 128K board
made, and the latest version is identical to the 512K board.
Hardly "from the begining".

Also, some expensive and difficult to use de-soldering equipment
is needed to remove the old chips.

Since I've been unable to deliver mail to the pollster in question,
I'll have to add my vote here. Yes, add a net.micro.mac ASAP! Not all
of us get fa.info~mac and I'm sure there would be more than enough
interest. Also, some of the type of language I've seen on this net
would seem to be more appropriate on net.flame.

Rumor at the last SF Mac UG meet was that the printer will cost ~$5K
and is intended to be shared among multiple Macs on an AppleBus network.
It has 2 *Megs* of RAM (for fonts?) using the same 256K chips as the Fat Mac.
If this is true the single user is out of luck for a while until the price
comes down...but WHAT A PRINTER!
     Does any one else have any info on this device?

I'd says the odds are 10 to 1 that its Apple's new laser printer to-be.
Steve Jobs was quoted in the September 17th "Portfolio Letter", describing
some new products, including a "dramatic breakthrough" in laser printing.

Some years ago, just as Pascal became popular, we read and heard much about using the "correct" programming language. Arguments abounded about using the correct level of abstraction in a program versus arguments the speed and efficieny of it's resulting code. You couldn't beat the Fortran jock by writing faster code, but you couldn't beat the his Pascal opponent by implementing more elegant and sophisticated algorithms. Doesn't the same argument hold true when choosing the correct langauge for the Macintosh?

Who won? Well, absolutely no one starts a new project using Fortran; however, not many use Pascal, either. It seems that no one won. Many programmers prefer C; critical applications demand assembly langauge; and a good deal of business gets done over APL and some coffee. The point that I am trying to make is that the right langauge should provide the right level abstraction for the task, and more. Sometimes it's nearly impossible to reach a creative frame of mind with a langauge that's obtuse to your thoughts. [See Alan Kay's and Lawrence Tesler's articles (you know who they are) in September's single-topic issue of _Scientific_American_.]

With the limited choice of compilers available, I will agree that most of them are barfworthy implementations; they won't survive their infancy. It is tempting to use something that produces beautiful code or gets the quickie program done. But then you will be stuck with an assembly-langauge recipe-finder, or a Basic, smart-terminal program that runs 50-baud serial-ports, or the chore of translating them. All because the right compiler implementation didn't exist at the time.

No one could say anything truer of the Macintosh. Software houses have come out with about 20 different C compilers for the IBM PC, and some of them generate straight-jacket-tight code. Why--competition and a growing market of demanding PC developers. (All this nagging is not in vain.) However, let's not limit ourselves to just C compilers. Here at the University of Rochester on a BSD 4.2 Vax exists a Modula-2 compiler (from DEC Western Research Labs) that blows away the Unix C compiler. (And we all know that Modula's syntax is similar to Pascal's.)

While I am not trying to be as dogmatic as Niklaus Wirth, the point is that you should choose a langauge that you like and is suitable for the job, and then get the right implementation/s as they become available.

> info you might have on the matter.

> Brent Haws - STC StorageTek (Disk Division)

TASC is guaranteed not to work with Diversi-DOS because TASC modifies its DOS when it runs, and the hooks it alters are in the wrong places in Diversi-DOS. My own method is to use a standard TASC disk to compile and then copy the resultant file off onto a Diversi-DOS disk. It occurs that TASC might POSSIBLY work with Pronto-DOS, which claims to have all internal hooks in the same places as DOS 3.3. I haven't tried it because I don't like what I've seen of Pronto-DOS enough to buy a copy just to find out.

I am told that the Einstein Compiler is better than TASC, but I haven't been curious enough to blow the money on ANOTHER compiler.

As a matter of speculation, TASC should have no trouble producing executables that will run under Pro-DOS, if you go about things right. Try this:

1. Compile your programme normally with TASC. Then use Diversi-DOS's PAD command to find out how long the binary is.

2. Recompile with the following address assignments:

a. Programme to begin at $1000, or immediately above hi-res screen if you use hi-res.
b. Library to begin immediately after programme binary, as determined by the length that PAD gave you.
c. Variables to begin immediately after library; library is just under $1000 long.

Example: for a programme that produced a binary $343A long, the addresses I used were $1000, $4500, and $5500.

3. Continuing with the address assignments from the above example, perform the following steps to save your file:

a. BLOAD RUNTIME,A$4500
b. BLOAD PROGRAMME.OBJ,A$1000
c. BSAVE PROGRAMME.EXE,A$1000,L$4500

You now have a single BRUNnable binary file - transfer it to Pro-DOS and it ought to work. Let me know if it does, as I haven't sprung for Pro-DOS yet.

It turns out that Apple has not made the 'plain vanilla' serial card for a long time. The only one they sell nowadays is the 'super serial' card. Whats more, the super serial card looks like it does just about everything you could reasonably want when interfacing to a modem or serial interface printer. It has a switch to enable transparent transmission of eight bit data. It has a switch to enable interrupts on each arriving character.
Answering my own questions,
Rick Thomas

[]

I have been working on a vt100/tek4010 emulator for the Mac using
Aztec C 68k. It is about 80% finished, and I will probably post the
tohexed source to the net. It is nothing super fancy, but has some
"features" I wish MacTerminal/Tekalike would have.

I have not received my "Inside Macintosh" yet and I would like to know
a couple simple things about the serial port.

- How do you send a BREAK. Is there a poke() you can perform or
  do you have to time out 300ms with no start/stops bits.

- What are the hex masks for no/even/odd parity, 7/8 databits and
  1/1.5/2 stop bits. I think I have figured it out with
  the old MacTEP source, but I would like to know for sure.

Thanks much..

Sorry if this gets posted twice, but I'm pretty sure the first one never
got out.

I'm ready to buy a C compiler for my Apple //e. I have a lot of info on the
Aztec C65 compiler from Manx, and I've pretty well decided that this is
what I want. I understand, however, that Manx also has Aztec C II which
runs under CP/M, and that they have a version for Apple CP/M. I'd like
some info on this compiler. Is there any advantage in buying the CP/M
version? I've heard that the DOS 3.3 version compiles rather slowly,
but produces fairly decent code. What about the CP/M version? I've seen
several other C compilers running under CP/M; would I be better off with
one of those?

By the way, I called The Programmer's Shop yesterday and found that Manx
is stopping mail order sales of their products through other dealers. So
if you want the Aztec C compiler, it looks like you have to order it

directly from Manx.

I tend to agree that Apple Computer Corp. is doing what any person would do. It is charging the higest price the market will bear. After all they are'nt in business to benefit mankind. Greedy captialist pigs and all that.

However $ 995 for the 512K upgrade is quite steep. I have read that 256K DRAMS go for around $ 20 a piece. Let's see that 512K = 16 chips X 20 bucks = $320. Add another 15 for the board and maybe 60 for the glue chips, pullups and caps and the price goes up to $ 400 bucks. Add 125% markup and you have the $995 cost all accounted for. A similar tale can be told for hard disk drives - OEM price around $400, Retail price $ 1995.

The moral being, If you don't like being taken by large, greedy corporations, you can always wrap your own boards and cut out the middlepersons.

Inasmuch as I'm about to buy a Mac, I'd appreciate some information about the
128K-to-512K upgrade (preferably from someone with first-hand experience or
reliable information).

I've done some pricing of the 128K and 512K Mac's. It seems that at certain
places, buying a 128K and the upgrade is only slightly more expensive than
buying the 512K. Since the upgrade supposedly comes with MacDraw and MacProject
the upgrade deal seems more attractive. My question is, if you buy a 128K Mac
now (after the 512K has been announced) will the upgrade really include the
extra software?

I don't want to buy a 128K now, wait for the upgrade (which isn't universally
available) and then find out that I'm not getting the freebies.

Any help on this is appreciated. Please reply by mail (unless you feel
the whole net would benefit).

Thanks,

Irwin Walkenfeld

Well, I have answered my own question this time, looking through the
workshop stuff in SUMacC I found what I needed.

For Aztec C68 the following function will do the trick, the union
and structure are as defined in the example "term.c".

```
SendBreak()
{
     long ticks;

     Control(PortA.refout, 12, &Csp);
     ticks = TickCount() + 14;  /* use 210 for a Disconnect */
     while (TickCount() <= ticks)
          ;
     Control(PortA.refout, 11, &Csp);
}
```

And it does work....

In a conference on compuserve, Bill Atkinson mentioned that the laser printer would go for under $3000, and a note I read LAST NIGHT (10/9) on CServe hinted (nay, said outeright) that there would be an Apple product announcement on the 15th or 16th. The note, btw, was from Dan Cochran, and was in reply to a query on why Assimlation (sp?) Process wasn't shipping the new MacWrite with the spelling checker.

Chochran's response was on the order of

   ...they are ready to ship, but Apple has asked them to wait until after the new product announcement of October 15th or 16th...

     I recently heard that the 65C02 was pin compatible with the 6502, and
that anyone with an Apple II,II+,or IIe can simply remove the 6502 from their
machine and replace it with the 65C02 and be able to use the new commands and
addressing modes. Has anyone ever tried this? Will it work?

Spent my lunch hour looking at Apple's new RGB card and monitor. The
quality is pretty good and you can do some fancy things like 80-col text
with low-res graphics (I know, just what you wanted :-). The 80-col text
mode is still inferior to text on a monochrome monitor.

The monitor is rated at 25 Mhz with a .38mm pitch. Someone has already
mentioned the motor drive in the tilt control. It looks like the Monitor
][.

I was interested, but my dealer says delivery would take 30 to 60 days. He
suggested the Taxan 410 RGB with 64k as an immediately available
alternative. He uses this card with his Taxan RGB at home. He claims both
cards (Apple and Taxan) are made by Video-7.

Does anyone have experience with the Taxan 410 card? One particular area of
concern is the RGB output. Apple says a "summing network" is needed with
their card and is (as usual,nowadays) vague about the pinout. The Apple
Monitor 100 has the network built in, but my dealer wasn't sure about his
Taxan monitor.

Question: What is the Taxan pinout? (My monitor is a Zenith 135 and can
accept a wide variety of RGB signals, but doesn't have a summing network.)

First, your question -- "what is the BEST programming language for the mac" --
is out of order: you program best in what you are most comfortable with.
There is a pretty clear consensus that MS Basic is about as poor as anything
you will encounter, but the tops is largely a matter of taste: no doubt
Jerry Pournelle will use Modula II when he eventually gives in...

Personally, I have MacFORTH level 2 ($250 list) which has a built-in
assembler that true FORTH hackers will want to have; even level 1 has a few
defining words that allow many of the toolbox traps to be reached, in addition
to the many traps that they support directly. More precisely, that is version
1.1. Window, menu, sound, and graphics are pretty well supported, and the
all-but-compiled object is pretty fast. A good, effective medium for probing
the toolbox calls, and you can do some learning and fun stuff while you are
waiting for a "good" modula II or native mode C or whatever.

In answer to another of your questions, the latest Club Mac News has an ad
for MacASM, a "co-resident Editor/MacroAssembler for the Macintosh."
Introductory price $100 from Mainstream, 28611B Canwood St., Agoura Hills CA
91301. Tel (818) 991-6540. I have no idea how well the fact corresponds to
the copy.

More generally, there is simply no way to make effective use of the Mac
AS A PROGRAMMER without the Inside Macintosh documentation. In for a penny,
in for a pound: for $150 you get Inside Macintosh, or you can wait for the
hardcover book (probably next Spring) for somewhat less money. For another
$100 you get the LISA WorkShop (WS) Supplement, which is the only way to

get the updates to the above AND they will throw in a copy of the hardcover
when published. They have had some REAL problems getting this stuff out
the door, but there is NOWHERE else to get the data.

The WS supplement, by the way, is not entirely useless: you also get 8
disks or so, 3 of which are readable by the Mac. I have no Lisa, but the
three disks I can read have lots of useful tools on them.

Let's see, so far I have told you how to spend $600 while you wait for the
right language processor. Sounds like enough for now. But if you are
serious, get Inside Macintosh FIRST.

Next Month.

With Apple it's always next month.

It's hard to argue with Bill Atkinson, and I would really love to see it
at that price, but the figure I've heard is almost twice that. I'm
trying to stay out of this, since I've seen the printer docs (ND
agreement), but can confirm that this printer is really truly going to
be better than any other currently available laser printer (that I know
of). It's not clear (to me) that the MAC is powerful enough to take
advantage of all its features.

The announcement date sounds about right.

Does anyone know how to get AE Pro to talk to Unix in an intelligent
fashion? I can connect, but the vt52 emulation seems to be out-to-lunch.
Vi doesn't work correctly and I can't even clear the screen properly.

I assume from all the positive reviews on the net that I am doing something
wrong. If so, I refuse to be defensive even if I'm missing something obvious.

Help please! It seems like someone should have solved this problem before.

By the way, does anyone know how to get Apple CP/M files back and forth from
DOS?

The SUMacC sources have not been posted to the net because of their size (megabytes, I believe). Also they run on 4.2BSD, and depend on an existing (unpublished?) 68000 C compiler.

Could some brave USENET make SUMacC sources available for uucp? I am more than willing to port SUMacC to System V, and can repost the results. Any takers?

Regards,
DJ Molny

The 68000 C compiler used in SUMacC is based on PCC and hence comes under
the AT&T license. That's another good reason why it hasn't been posted.

Also, it's still officially "beta test". True there haven't been any bug
fixes lately but there have been enhancements to the rmaker quite recently.

I know that plans are afoot to make the environment more available once it
leaves "beta" status. In other words, based on a conversation I had down
at Stanford two weeks ago, it is clear that a mechanism is being set up for
its distribution.

SUMacC also runs under 4.1 bsd.

On another subject, maybe it would be better to post SUMacC code in
uuencode format rather than tohex format. Uuencode does not expand
the file as much.

Hello, netland!
I'm stuck in Zork I for the Apple][+. I have 298 points. There
are several things I have not been able to figure out:

egg: to get the small-clockwork bird out of the egg, I think you have to give it to the thief, come back later, and get the egg back from him (by killing him?). When I kill him, it says,"His booty remains," but there is no booty -- in fact, the program does not know the word booty. Is there a thief's hideout I have not found?

grate: Evidently, the lock to the grate is on the underside. The skeleton key ought to unlock the grate, but from where?

timber: Use?

Thanks in advance,
Stephan Schell

.na
.TL
SUMEX MacC UNIX Development Kit
.AU
Bill Croft
.AI
Stanford University
Medical Center
SUMEX Project, rm TB105

Stanford, CA 94305
.NH
Introduction
.PP
This 'short' note describes the current state of our UNIX/C development
environment for the Macintosh,
.I SUMacC
("some-max"). At present the
release must still be considered in a beta test stage. Although
all the test programs we have tried so far operate correctly,
there are no doubt some minor bugs still lurking in there somewhere.
.PP
We are distributing this package under the condition that it may
be "used" but not "sold" without our permission.
Any fixes or enhancements made to the package should be reported
back to us, for incorporation into future releases.
While we will attempt to fix bugs and provide new features, no
warrantee is expressed or implied. You are basically on your own.
.PP
Since this is a beta release, and since we are not equipped to
duplicate massive amounts of tapes and disks, we are limiting
distribution to those who can use the Arpanet to FTP a copy from our
SUMEX-AIM host, or from another nearby host on the Arpanet.
To facilitate this, we ask that anyone picking up a copy be willing
to act as a redistribution point. Send a note to
.I croft@sumex
giving the pathname and anonymous FTP login to retrieve a copy from
your host. I will post a note to
.I info-mac
a few days after
release summarizing where folks can pickup a copy.
.NH
Prerequisites
.PP
The package is currently only setup for a VAX running 4.1 or 4.2 BSD
UNIX. It should be convertable to any other UNIX box having
a 68000 C compiler.
.PP
We assume you have some release of the Apple
.I MacTerminal
program.
This is used to download a printable hex file from the VAX
to your Mac disk.
.PP
Since we don't have the resources to duplicate Sony disks for
everyone outside the Stanford community,
we also assume you have access to a Lisa (Mac Workshop) development
system. This is used, one time only, to put a program on your
Mac disk (called
.I fromhex
) that takes the printable hex output
from MacTerminal, and turns it into binary resource file (fork).
Below in the

.B Downloading
section, we discuss possible
alternatives.
In any case, it's simply handy to have at least one Lisa system
available occasionally, since this is how new software is
released from Apple.
.NH
Contents of the Kit
.PP
The following directories/files are in the distribution:
.IP sumacc.ms 12
This file, in \-ms macro format.
.IP Makefile
Master makefile that calls Makefile's in subdirectories.
.IP cc42
C compiler binaries for 4.2 BSD.
.IP cc41
C compiler binaries for 4.1 BSD.
.IP ccsrc
C compiler source (if provided).
.IP h
Macintosh header files, copied to /usr/include/mac.
.IP lib
Macintosh library files.
.IP cmd
Resource maker and other Macintosh related commands.
.IP test
Some Macintosh C test programs.
.IP man
Manual pages.
.IP ws
Reference copy of most of the sources distributed with the Lisa Workshop.
.NH
Installation
.PP
The makefiles included have been conditionalized so that you can
change where the files reside after installation.
At Stanford for historical/political reasons
the binaries are in
.I /usr/stanford/bin,
the library stuff goes in
.I /usr/sun/lib,
and the include files are kept in
.I /usr/include/mac,
or
.I /usr/stanford/include/mac.
If you change where things are located, you will have to: (1) edit
the master Makefile and/or the sub-Makefiles to change the installation
directory names. (2) Edit
.I cmd/cc68.c,
the C compiler driver so that
it can find the assembler/loader/etc.
This is easy to change for

.I /usr/stanford/bin,
but since the
.I ld68
and
.I as68
binaries provided have
.I /usr/sun/lib
wired in, you may want to leave that one alone.
Use
.I mkdir
to make these directories if they don't already exist.
Another possibility to change the file locations is to use the
symbolic link facility on 4.2 to (e.g.)
.I
link -s /usr/local /usr/stanford/bin.
.R
.PP
If your VAX doesn't already have
the 68000 compiler installed,
.I cd
to
.I cc42
or
.I cc41
and type
.I make.
This will install all the compiler binaries (except cc68).
.PP
.I "4.1 BSD:"
If you are running 4.1, edit cmd/cc68.c to remove the '#define BSD42' line.
Also edit lib/Makefile so that the lint library is constructed with 'mk41lint';
(4.1 lint doesnt understand the '\-C' switch.)
.PP
Now from the main directory, do a
.I make.
This will compile and install the commands, Mac library,
Mac lint library,
include files, manual pages, and test programs.
.PP
If you don't already have a
.I SUMACC
Sony disk with
.I MacTerminal
and
.I fromhex,
then you need to make one.
On a Lisa Mac Workshop system, use the
.I terminal
program to download the file
.I cmd/fromhex.p
from the VAX to the Lisa. The filename on the Lisa will
be something like
.I example/fromhex.text.

Then using the generic exec script on the Lisa, compile this Pascal
program and put the resulting binary on a Mac disk along with
MacTerminal.
.PP
At SUMEX our SUMACC disks also contain the
.I
Resource Mover, Set File, Examine File, MacsBug, Disassembler,
.R
and
.I Disk
.I Copy
utilities. These are useful utilities supplied on the
.I MacMaster
disks that come with the Workshop.
.PP
You should now be able to follow the instructions under
.B Downloading
below to try out some of the programs in the VAX
.I test
directory.
.NH
Test Programs
.PP
The C test programs provided are:
.IP MacScrawl 2
A primitive text/drawing program that was used to test out
the Quickdraw and Event Manager routines. Its commands are
single keyboard characters; examine the source code before
trying to use it. Try the 'm'agnifying lens to zoom in and out
on sections of the screen and/or the lens itself. In one-to-one mode
there is some interesting stuff going on at the bottom of screen memory.
.IP Grow
This is a straight translation of the Pascal Grow program provided
in the Workshop. Windows, events, menus, TextEdit, and
desk accessories are all exercised.
As an exercise, you might runoff a listing of grow.c and grow.p.ws
(in the same directory) to compare how the Pascal was translated to C.
.I
Note a bug:
.R
both the Pascal
and the C version apparently do not save TextEdit state when the
Notepad desk accessory is in use, resulting in weird behavior
with that accessory.
.IP Insane
This tests the SANE IEEE 80 bit floating point package and
numeric conversion. Floating operations seem to average
about 1 millisecond (well you can't say it isn't accurate...).
.NH
Typical Compilation Cycle
.PP
Examine the Makefile and *.rc (resource compiler input)
files in the test directory.

The makefile typically looks something like:
.DS
.I
cc68 \-m grow.c
rmaker grow.rc
tohex <grow.rsrc >grow.dl
.R
.DE
.PP
Cc68 compiles, assembles, and loads the C program onto a file
called
.I b.out.
Next the resource maker (sometimes called the resource compiler)
reads the file grow.rc.
This file directs rmaker to read the binary b.out and combine it
with some hex icon information in grow.rc. The resulting
output, which would be directly executable on the Mac, is
left in the file grow.rsrc. (rsrc stands for 'resource', and
is the same suffix convention that is used on the Lisa).
.PP
Finally, since the current download scheme uses
MacTerminal, which only understands printable characters,
the trivial program
.I tohex
converts this binary info into hex nibbles that MacTerminal
can handle. It also adds a checksum for security.
The resulting grow.dl (for 'download') file is then
downloaded to the Mac using MacTerminal, and reconverted to
binary, using fromhex.
.PP
From time to time, you will also want to
.I lint
your sources to ensure proper matching of argument and data
types. For example:
.I
lint grow.c -lmac
.R
.NH
Current State of Downloading
.PP
After obtaining a download file (e.g. grow.dl) from the compilation
cycle, you download it as follows:
.IP [1] 4
Launch MacTerminal. When it comes up, type
.I
cat grow.dl.
.R
The file will scroll by on the screen and at the same time MacTerminal
will be saving the 'lines off the top' into a file.
If you were previously using MacTerminal before the downloading
step, then you will want to select the
.I
clear lines off top

.R
menu command before catting the file. Alternately you could
turn on the
.I
File Transfer / Remember Lines off Top
.R
mode just before the cat.
Personally, I use another terminal for my VAX work and I throw
an RS232 switch just before I invoke MacTerminal and cat the file.
.IP [2]
With early versions of MacTerminal, the output file is called
.I TermCache.
The latest version of MacTerminal places this output into the data
fork of your MacTerminal configuration file. For example
if my configuration file is called 'C', the baud rate settings and
so forth are held in the resource fork of C, while the 'scroll-off'
is placed in the data fork of C.
.IP [3]
After the cat is complete, hit a few more CRs, to ensure that
the lines are 'scrolled off the top' and thus saved. (There's
a shell file in
.I test/mcat
to do this if you're lazy).
Then exit MacTerminal.
.IP [4]
The fromhex program takes its input from a file called 'C' and
places the output on 'C prog'. If the output from MacTerminal
is not already named 'C', select it with the mouse and type 'c'.
This will change the name (case is not important).
Now launch 'fromhex'. If all works correctly it will read 'C'
and create an executable 'C prog'. If the checksum fails
(very rare), it will beep at you, which tells you to try
the transfer over again with MacTerminal.
.IP [5]
Finally (phew!) you can launch 'C prog' and it will execute.
Rename 'C prog' to something else if you want to keep it around
and run fromhex some more.
If your program uses a special icon (as do the samples provided),
a strange feature of the 'finder' requires that the 'bundle'
bit be set at least once on one of these binaries. You
can use the 'Set File' program for this. After finder
caches the icon in it's 'DeskTop', further bundle bits are
not needed.
.NH
Future State of Downloading
.PP
Needless to say, the above sequence is less than speedy.
Here are some other possibilities:
.PP
The next version of MacTerminal will have a working Modem7
file transfer mode. I have heard that there are UNIX versions
of this floating around (where?) Martin Haeberli also tells
me that this new version will recognize special 'control codes'

in the data stream, if in 'Macintosh' mode. These codes allow
the data stream to be directed to either the data or resource
fork of the destination Mac file. Thus the UNIX modem7 could
have a switch for directly transfering the *.rsrc file into
a resource file on the Mac. 'tohex' and 'fromhex' could
be tossed.
.PP
Martin says that modem7 and MacTerminal are somewhat inextricably
bound, thus putting another protocol (such as Kermit) into
MacTerminal would not be easy. However, what about this:
the C version of Kermit already exists and with a moderate
amount of effort, a dumb terminal emulator could be added to
it. This would give us our own terminal emulator to
customize to death, and allow Kermit access (which seems
to be more common in Arpa land). Any volunteers?
.PP
When we get our act together here at SUMEX we plan to
start working in ernest on our MacEther file server.
In this case you would simply click open the server disk
icon and launch the program. Current SUMEX priorities
are preventing me from continuing work on this at the moment.
.NH
Toolbox Programming
.NH 2
Argument Passing
.PP
When using
.I
Inside Macintosh
.R
to program in C, you must do a mental translation of the
Pascal calling conventions into corresponding C conventions.
They are really quite straightforward and even if you goof
up, lint will warn you.
Take a look at the sample programs to get the hang of it.
Remember that a Pascal VAR, means a variable passed by
reference (address).
Here are the conventions:
.PP
When passing a structure or string, pass its address.
Pointers or handles are passed the same as in C (by value).
If Pascal expects a VAR, pass its address (if it's
a structure or string, you've already
converted that to an address (rule above)).
.PP
SUMACC also does automatic translation for 'integer'
and 'string' formats during Toolbox calls. The default
integer in Pascal is a short, while C assumes it is a long.
Pascal strings are not null terminated and instead begin
with a byte count.
Some further implications of this mechanism for strings
are discussed in a section below.
.NH 2

Handle Dereferencing
.DS
The Pascal notation
.I
hTE^^.viewRect := pRect;
.R
is translated as
.I
(*hTE)->viewRect = pRect;
.R
.DE
.NH 2
Pascal Bird-Nest Soup
.PP
Compare test/grow.c with test/grow.p.ws. Notice how the C version
can use many less nesting levels than Pascal by proper use of
.I
break, continue,
.R
and
.I return
statements. (In my opinion) this greatly improves the readability
and understanding of C programs.
C programs also allow much easier setup of initialized global
data and strings. Part of the reason 'resources' are so
common in the Pascal example programs, is that they allow
an 'easy' way for Pascal programs to access initialized data.
Of course this must be tempered with the fact that these resources
must be named and numbered in another file and introduce another
level of indirection in understanding a program listing.
The plus side to resources is that they allow easy language
translation of your program, but how many of the programs you
write will have that wide a distribution? If source is available
you could achieve a similar affect by placing your language
dependent strings in an ifdef'ed section or include file.
.NH 2
String Utilities
.PP
Normally on Toolbox calls, the routine
.I mactrap.s
converts automatically
between the C string convention
and the Pascal strings expected. This occurs both
on passing the argument via the function call, and on string
VARs returned.
Thus in 99% of the cases you need do nothing special for strings.
However occasionally a Pascal string is embedded in a Toolbox
structure or a something similar.
In such cases there are these functions to help out (see test/grow.c
for an example call and lib/strconv.s for more detailed info):
.IP c2pstr 8
This converts a C to Pascal string in-place by shifting the C string
down one position and inserting a byte count at the beginning.

.IP p2cstr
This is the converse operation of converting a Pascal to a C string;
the byte count is removed and a trailing zero byte added.
.IP isapstr
This is a function; it simply negates its argument, which is
a string pointer. If passed to a toolbox routine that expects
a string, this negative pointer will override the default
C to Pascal string conversion. In effect the function states 'this
argument is-a Pascal string'.
.NH 2
Heap vs. C Bss
.PP
Uninitialized globals in C are placed in an area called 'bss'.
In the current implementation, bss is reserved by appending
that amount of trailing zero bytes to the CODE resource.
(The Mac segment loader has no convenient mapping for
a bss notion contiguous to text/data; sorry).
Thus you can use uninitialized globals as normal, but if you
have any truly large structures (over a few hundred bytes), you
should call the Toolbox routines
.I NewPtr
or
.I NewHandle
to get piece of the heap,
and place the pointer or handle to that area in a global variable
instead. This is actually a common C coding practice on
UNIX, using the
.I malloc
routine there.
.NH 2
Pascal Toolbox Calling on C Routines
.PP
Yes this does happen (rarely). For an example see test/grow.c in the
routines ScrollUp, ScrollDown. Basically your C function must
call an assembly helper (getpargs) to fetch the Pascal arguments.
.NH 2
Floating Point
.PP
See test/insane.c for examples of SANE usage. However you may
be better off with the fixed point arithmetic provided by
.I
FixRatio, FixMul, FixRound
.R
discussed in the Toolbox Utilities
section of Inside Mac.
.PP
The MIT C compiler we are using also has its own built-in
floating point formats and library routines (in libc.a),
but we have no experience with these.
They are certainly not the IEEE standard.
.NH
Compiler Sources
.PP

The normal distribution contains only sources for the code we
have written here at SUMEX. Since the compiler is based on
the Bell Labs (Johnson) Portable C Compiler, we must be careful
about distributing copies of this.
It's also unclear to me what good the compiler/assembler/loader
will do for you, since it's a large and somewhat crufty
amount of code.
As an interim policy we
will make these sources available to other Universities if there
is enough interest.
However don't ask unless you plan some active
development in this area.
.NH
Currently Unimplemented
.PP
Overlays; MacPrint interface and linkage; Graf3D (but see
lib/TODO for a hint on how to convert this).
.NH
Freeware
.PP
If you think sharing stuff like this is a good idea, then I
encourage you to make your own projects available to the
info-mac community. Post a note to info-mac and tell folks
how to FTP the program from your site; alternately SUMEX
would be glad to archive your programs for FTPing in our
info-mac directory.

Does anyone still make hard disk subsystems for Apple II+ computers?
I have an Apple with CP/M and Pascal, and need a hard disk (too many
floppies!) for storage (10Mb). I would appreciate any pointers or
references - please mail them to me via the net (I LOVE mail). If
there is sufficient interest I'll summarize to the net. Many thanks!

From: Dan Chernikoff <dan@sri-tsc.ARPA>

I believe that Corvus is still making 10 and 20 Meg hard disks. IN fact
they have this funky system called a "Constellation II" that allows you
to hook up a 20 Meg corvus to BOTH an Apple II and an IBM PC at the SAME TIME.
Pretty bizarre. Unfortunatly I don't have their address, but they are
a local (Silicon Valley) company -- probably Mountain View CA.

Good Luck!

[Something to eat]

To whom it may concern,

We at the University of Amsterdam our doing some development for the
Apple Macintosh computer, but are currently using a combination with a
Lisa to do that.
From what we have read in the news it is clear that there are other
possibilities such as the SUMACC c-compiler.

We would be interested in reactions from all those people who are
using any other means than the Mac-Lisa combination for development.

Please mail me what systems (hardware/software) you are using, what it
costed (approx.) and if possible also mention any addresses we can use
to get more info. Especially the contact address at Stanford is
needed, since we would like to contact them.

When addresses are given please give both electronic mail addresses as
well as the addresses for conventional mail.

After we have filtered all incoming info, I will summarize to the
net.

I have an Apple 2+, and I am interested in playing with sounds.
By playing, I mean at the lowest level.
What I want is a card, compatible with the 2[+EC] open architecture slots,
containing an ADC and a DAC.
I will supply any microphones/speakers/aux input,
provided the jacks are standard.
Let me clarify, I do not want music synthesizers, speech chips, etc.
I only want a raw ADC and DAC.
Is there an apple 2[+EC] card with these devices.
I know it would not be difficult to build one,
but I am not a hardware wizard.
Any leads appreciated.
Thanks in advance.

I have been running my Apple //e for a year with the Apple 80-col card, the

CCS7710 serial card, Hayes 1200 external modem. I use this equipment with
ASCII Express software.

The problem is that I had borrowed the the CCS7710 board. I bought the
Apple Super Serial card for this system and I am having problems
geting it to run. I configured the board to 1200 baud, communication
mode, no interupts, 8-bit ASCII 2 stop bit no parity. I also replaced
the null modem cable used with the CCS7710 board with a cable which provides
straight through connections. The board's jumper block is
configured for a modem.

I changed the comunication driver in the ASCII Express software to
the Super Serial Card.

When I use the system, the auto dialer outpulses, I get through to the
remote computer, but the screen prints garbage, the high speed light on
the modem is out and ASCII Express has switched to 300 baud.

Is any one out there using such a combination? If so I would like
some hints.

..ihnp4!ihu1g!jjsk   Thanks,
                        Jim Kent

<This *is* my first attempt at the infamous net>

Anyone out there know anything about foreign languages on the pc,
mac, or other microcomputers? We in humanities at Duke want to do
word processing and data base work with documents in Greek, Latin,
Hebrew, Coptic, and several other esoteric languages.

Our inclination is to go with one of the "standard" machines and
write patches to handle the non-roman alphabets (I've already done
a lot of this for our Victor 9000s). If, however, someone already
has the software, and would make it available *reasonably*, it would
save a lot of time for me not to reinvent the wheel.

Thanks for the help!

I bought a pair of John Bell Eng. adc/dac cards and a parallel port board
for about $150 in kit form. It is about the best system I have found for
the money. The ad/da's are 8 bits whivh provides enough resolution for
playing around with sounds (adc sample rate is 50 kHz)
     With those components, I have managed to make some digital echo
effects and a few other pretty interesting digital processing sounds.

Check a Byte Magazine for John Bell Engineering's address.

The Sept 17 issue of InfoWorld (pg 63) also has a note about this problem.
Someone found that the IIc will not work with either Hayes smartmodem or a
Anchor Signalman at 1200 baud.Maybe the FTC will make them start advertising
a 1165 Baud modem.

[Brrrzrip...eat that, bug! Oh, you want some mustard, too? Oh well.]

Here are the responses to date that I've gotten on my query about the Manx Aztec C compiler for the Apple. To those that sent me responses and didn't get a thank you note, it's due to some strangenesses in the local database on how to get from here to there. Please consider this a thank you.
     Dieter Muller

==========

From: Doug Gwyn (VLD/VMB) <unm-cvax!cmcl2!seismo!hao!hplabs!ucbvax!gwyn@Brl-Vld.ARPA>
The current Aztec C for the Apple II from Manx supports DOS 3.3, not ProDOS. The ProDOS version is held up by the Macintosh C project, which is scheduled for September delivery. Aztec C can be asked to generate either native 6502 machine code or interpreted code. The interpreted code tends to be smaller, the machine code faster. They can be mixed in the same program binary, so one can make appropriate space/time tradeoffs. There is also support for overlays, and a command language interpreter (mini-shell) that programs can be made to access for some library routines, to save space. The manual is pretty good (the only noteworthy omission is interpreted code specs), and the language and supplied library are a fairly full implementation of C. Sources are included for the library (except interpreter) and many of the utilities (screen editor, archiver, device drivers, but NOT compiler/assembler/loader/shell). My only real complaint is that I wish they would hurry up with the ProDOS version, as I am getting tired of compiling on DOS floppies then moving my binaries to the ProFile.

==========

From: unm-cvax!cmcl2!seismo!hao!hplabs!ucbvax!FRIEDMAN@RU-BLUE.ARPA

     The Manx C compiler compiles to either 6502 or M-code with a size vs speed tradeoff. It also contains assemblers for both 6502 and M-code. Currently the ProDos version is not available but it will be out "real soon now". The programs can be run under the Shell or standalone. If they are not run under the shell, the 80 column support becomes minimal. The shell replaces the comand processer of DOS (and maybe the file manager?) and comtains the command cp, cat and ls. It also contains IO redirections (cat test > pr:).
    It come on 6 disk. They contains the linker, compilers, assemblers, an editor (VED) which is bad but usable, libraries, and sources to the libraries (floating point and I/O, for 6502 and M-code, with and without the shell. 6 total.) and the editor in C.
    It can use standard DOS files and standard normal files (with high bit off and cr/lf at end of line). The shell requires STANDARD DOS so it will not even run with a Corvus hard drive.

The manual explains the interfacing to assembly language and adding device drivers so you can add your own functions etc.

-Gadi

==========

Aztec C (from Manx Software) for the Apple has all the features of C except for bit fields. Two versions of the compiler are included: a p-code version and a native code version. Both compilers are rather slow but produce fast code. Also included is a vi-like screen editor, libraries, a simple shell and a few tools. Source code (in C) for most of these is included. I am not too familiar with the CP/M version, but I think the compiler would be identical (except for funning faster on a z80).

Dave Newkirk, ihnp4!ihuxl!dcn

We use the DOS version of the MANX compiler on our Apples here at the Ergonomics Lab. The package comes with two compilers: a native code compiler and a pseudo-code compiler. The first sacrifices space for speed while the second generates less code but demands that an interpreter be present in memory. The license agreement allows the production of standalone binaries for sale without royalties to be paid to MANX.

The libraries conform to stdio, but there are a few routines added to ensure compatability with DOS's notion of what a newline is.
There is no graphics library (we had to write one ourselves).

The one complaint which everybody makes about this compiler is its speed (or rather the lack of it). It is slow. Make that s..l..o..w.
A 500 line program can take up to 20 minutes to compile and link.
Nevertheless, we are satisfied with it and have no other serious complaints.

Les Gondor, U of Toronto CSRG
{cornell,ihnp4,allegra,uw-beaver,decvax!utzoo}!utcsrgv!lgondor
CSNET: lgondor@toronto ARPA: lgondor%Toronto@CSNet-Relay
"Strange women lying in ponds and distributing swords
is no basis for a system of government!"

I have purchased the Manx C65 package about a month ago.

To date I have been impressed with its quality and functionality.
It *does* produce true 6502 machine code, and through some careful optimization, came be made to run quite fast. As an exampl, I am working on a graphics package now, written in C. The line drawing algorithm is comparable in speed to the routines in the Apple rom.
It supports a pseudo UNIX shell environment with built in ls, cat, mv, cp, etc commands. The full stdio library is supplied *with source*.
All the hooks are there into DOS3.3 for file IO including a subroutine for

RWTS in addition to the lock, unlock, catalog, read, write, etc.
It's the best $200 you can spend if you are a real 'C' fan like me.

Organization: System Development Corporation, Santa Monica
Lines: 48
Summary:

>From the various descriptions of the problem, the Apple is providing
one half the color burst frequency instead of 1.8432Mhz for baud rate generation.
The former is easily derived from the 4x color burst crystal used in all
Apples (makes generation of color images an incidental (but wanted) side

effect of the B&W video circuitry. The latter is one of a half-dozen
popular frequencies for Baud rate generation (1.8432MHz = 2^13 * 3^2 * 5^2)
which get most popular rates exactly (e.g. 1.8432MHz/3/512 = 1200) with
simple counters. (For asyncronous transmission, you normally want 16*baud).
There are also three completely different circuits used for baud rate
generators.
a) A couple of chains of low divisor counters with output taps between most
  stages (e.g. once you get 9600, sucessive halvings get most other common
  rates
b) A polynomial (mod 2) shift register which can divide by almost number but
  requires initialization values which are hard to compute. Generally these
  values are hardwired into a small table. It's advantages are that you
  can select almost any (fixed) set of input/output relationships with less
  circuitry than (c).
c) A general divide by n counter of 12 to 16 bits. Takes more circuitry,

  but easy to program. E.g. to get 1200x16 clock for most UARTs at 1200 baud,
  program divide by reference/(1200x16).
Apple seems to be using the divisor needed for a 1.8432MHz crystal (96)
with 1,789,773 Hz reference (which needs a divisor just over 93).
[With type a circuitry, you can't divide by 93, so you're stuck with
1165.22 baud; with type b, your stuck if you use a part meant for 1.8432MHz,
instead of paying for a custom version; with type c or custom b, you have
your choice of 93 as a divisor (giving 1203 baud) or 94 (giving 1190 baud).

The fastest fix is to provide the right crystal for the serial chip (note
that you will need a resistor or capacitor in addition to the crystal;
you will have to check the data sheet for the proper crystal hookup).
It also fixes all baud rates.
With a type c baud rate generator, an alternate fix is software, but waiting
for Apple to produce and distribute a revised ROM will take months, and will
still leave high baud rates on shakey grounds; at 9600 baud, you are stuck
with dividing by 12, giving a rate 3% low again.
[An amazing amount of trouble to save $5 for the crystal!!!]

     I tried this weekend to use fromhex.bas (downloaded from fa.info-mac)
to convert fromhex (recently posted by Mike Ward to net.sources). There is

a problem somewhere--the program reads a couple of records and then gives an illegal function call error. Investigation shows that the ASC function is being called with a null string, which in turn appears to be related to the fact that a "pointer" to the data from disk has run past the end of the data.

I played around with this a while and finally made the program check for this condition and read what I hoped was the next record. This let the program complete, and gave me a program named "C prog", as billed. But "C prog" is 0 bytes long! So something is still not right.

Has *anyone* been able to get fromhex.bas to do its thing correctly? If so, I would appreciate hearing from you!

Incidental question: Why are the records of the fromhex.dl file 66 bytes long, when one wants to read these records in groups of four or eight bytes? Are those "leftover" bytes a checksum, or something?

Has anyone written Aztec C programs which use the hi-res display?
This should be possible since you can tell the loader where to put stuff.
What I need is a routine to draw dot (x,y), but any additional stuff
(line/circle generation) would be interesting. Please reply by email.

Also, if anyone has found more bugs in the system please post them.
I have two: (1) the function which returns a random double is called
"ran", not "random" as in the manual; (2) wrong code is generated for
"i = (j ? 1 : -1);" -- if j is 0, i gets 255 instead of -1. It is not
clear that Manx will fix anything, so it is important that bugs be publicized.

Subject: Re: Apple II+ hard disks???

Corvus Systems, Inc. San Jose, Ca (408) 559-7000 makes hard disks
for the Apple as well as other personal computers. The Corvus allows
the hard disk to be partitioned into Pascal,CP/M, and DOS volumes.
They also have hardware and software for backing up the hard disk to
video tape, and offer networking for multiple computers sharing a
hard disk. I have used their system for almost 5 years, and have
been pretty pleased with them.

Subject: Re: Apple II+ hard disks???

Dale,
I have recently gotten a Davong 15 Meg system. It can support CP/M,
Apple DOS and Pascal volumes. There is a good summry of hard disk
manufacturers in the Compupro reports. If you have any specific

questions, I'll be happy to answer them.

Subject: Re: Apple II+ hard disks???

Corvus Systems (San Jose) makes a hard disk that supports DOS 3.3 and
Pascal 1.1 (last I heard). By now, it may also support CP/M and ProDos.

Subject: Re: Apple II+ hard disks???

I believe that Corvus is still making 10 and 20 Meg hard disks. IN fact
they have this funky system called a "Constellation II" that allows you
to hook up a 20 Meg corvus to BOTH an Apple II and an IBM PC at the SAME TIME.
Pretty bizarre. Unfortunatly I don't have their address, but they are
a local (Silicon Valley) company -- probably Mountain View CA.

Good Luck!

Subject: Re: Apple II+ hard disks???

Just look around in any magazine on apples and you will find that
there are many hard disks available for the II+/e. Do spend some time
looking at the Corvus systems, as they are by far the most popular.

From The Chicago Tribune, September 11, 1984

"Apple computer announced a Macintosh personal computer with additional
memory and a memory expansion kit and $300 price cut for the current
128K byte model. The new business [???] computer, which will have 512K
bytes of memory, is being introduced several months early because of
the availability of memory chips. It will retail for about $3,195. The
128K byte system, reduced to $2,195, can be expanded to 512K bytes for
$995."

I've noticed a statement in some Applesoft BASIC
programs running under Pro-DOS that I can't identify
in any of the documentation that I have. An example:
    & "GOTOYX",param1,param2   or
    & "JUSTIFY","string",param
There are no files on the disk with names like "JUSTIFY" of
"GOTOYX". Could someone enlighten me please.

Has any one who had an original Lisa had any problems
in upgrading it to a Lisa II.
Also, have any of you complained to Apple about the loss
of a disc. (ie. 2 800Kb floppys for 1 400Kb semi-floppy).
I complained to Apple saying that I wanted 2 of the new
discs, but they said no!! Has ANYONE ELSE had any better
results.
We spend $10 Kbucks on this thing and Apple seems
to have forgotten us!!
Please, mail me ANY information you have. I think
we're all in the boat, so maybe jointly we can get
so reasonable results.

- So long for now!!

I just downloaded the font editor and resource mover from Compuserve, and have been playing around with them. I made a "new" font (a slightly edited version of an existing font), then went to install it. Brought up MacWrite, and there was the font name in the menu, but both it and Geneva were checked on, and what I got was Geneva. Well, thought I, there must be a collision in the resource numbers of the two fonts.

So, I started playing around with the number of the new font. I also began using the font mover to install the font, rather than the resource mover. So, the next problem was that I clobbered Toronto--when I would bring up the new font, the installed Toronto fonts in the system took on the name of the new font! Another result of a resource number collision.

After playing around some more, I realized that there is a base number of the font, and the various sizes are offset from this base number by the value of the point size. Soooo.... the problem is merely to pick a base number that does not collide with the existing ones. After fiddling around, I got a base number for my new font which is OK (for now). But it was apparent that there is not complete freedom in choosing the base number. The question is, how do you choose this base number? Is there a fixed number of "slots" between one font and the next? If not, where is the variable number of "slots" (for want of a better word) stored--can I get at it with the resource mover? Does someone have a list of the currently occupied numbers?

Pls answer by mail.

*** FOR SALE ***

A cross reference program for Microsoft Basic in Microsoft Basic. For those of
you
who aren't familiar with cross reference programs, the program produces a
sorted printed listing of all variable names and numbers used in a program.
Each symbol is printed along with the numbers of the lines it appears in.

Very handy utility to use when debugging MS Basic. It is very helpful when
using VARPTR to find out where you created that new variable, especially
when GOSUB1150 is a variable and GOSUB 1150 is a subroutine call.

Price is FIVE BUCKS ($5) with your disk and SASE. Or send $13 and I'll provide
postage and disk.

I've found 'Softerm' to provide good VT100 emulation for the Apple II+.
It handles the keypad mode well (ctrl-f, 'number'), so DEC's EDT is
usable with a little practice. The new version (Softerm II) requires
the use of a slot, though, but will emulate more terminals (I think)
and handle more 80-col cards.

Your Apple dealer does. Ask for the "Apple //e Reference Manual". The
80-column firmware listings are in the accompanying supplement.

[It is pitch black. You are likely to be eaten by a --]

The following is a massive diatribe levelled at Steve Jobs and his band of merry highwaymen down in Cupertino. Apple fans with sensitive constitutions, consider yourselves warned.

I just received news concerning the Fat Mac, of which we have all heard so much: the Macintosh, with 512K. It has been released and is on its way, delivery date approximately three weeks (or thereabouts; delivery dates haven't been Apple's strong point lately).

I also received news about its price.

Brace yourselves.

$995. Yes, you read right: that's nine hundred ninety-five big ones, to be removed deftly from your wallet and placed just as deftly into theirs. All that on top of the $2495 (or $2195, if you happened to get it in one of the recent sales that have started to spring up here and there) which all us Macfans have already shelled out.

[Background: My friends and I who purchased Macs are not the businessmen-types that the Mac seems to be aimed at. We are but simple college students, not fortunate enough (or rich enough, as the case may be) to attend one of the schools in the Apple University Consortium, and get our Macs for dirt cheap. No, we go to the University of New Mexico, in the Land of Enchantment (Land of Enchantment? You've got to be kidding. Do you know what it feels like to live in one of the few places in the civilized world where you can still catch the bubonic plague? The PLAGUE, for God's sake!!!). Therefore, we had to spring for the big bucks, and don't get off on this account. OK, back to righteous indignation.]

They have got to be kidding! When the Mac was first announced, the price was $1995; not bad, considering what you get in a Mac. Then, when it finally saw the light of day, filtered through display windows, the price had somehow escalated to $2495 -- for the bare-bones system, of course. Steep, but still within the range of those of us fortunate enough to have that kind of cash handy or to have a sympathetic loan officer. This, of course, was the 128K Mac; the fully-realized Mac was on its way, by the end of the year, just hang on, we'll get it to you, 512K, Real Soon Now, wow, gosh ...

Well, they sure got it to us, all right. For the measly sum of damn near a thousand bucks extra, we plebes can get ourselves the system that should have come out in the first place. So now Apple has us all over a barrel. We all sprung our $2995 for the Mac and the printer, and shortly afterwards realized that the thing was absolutely useless without

the second disk drive. So, another $495 went down the drain. Next comes the realization that with the basic 128K, the user is left with too little memory to accomplish anything significant. So, another $995 down the tubes. Thus Steve Jobs' vision of the computer that anyone can use has become the computer that no one can afford, because a workable system sells for $4485. What a bargain!

Looks like Steve & Co. are standing by to rake in the big bucks; The Rest of Us can all bend over and grab our ankles. It's coming in dry, folks; no Vaseline on this one.

Now, damn it, I really like the Mac -- I really do. It's got a few rough spots, but nothing a little software and minor hardware changes couldn't fix. That's what the Fat Mac was supposed to be all about, at least as far as hardware went. I, personally, wouldn't own anything else, certainly not another faceless, amorphous blob from the IBM PC CloneMakers. All in all, I think it's the best thing to hit the market since -- well, since the Apple II. And buying Apple is like buying Hewlett-Packard: once you buy one, you tend to stick with it. At least, I do, and I'm sure there's a lot of people out there like me.

But pulling little stunts like this is not going to earn old Stevie Boy any new friends. I can hear Jerry Pournelle cackling away in the depths of Chaos Manor now, chortling, "I told you so!" Oh, sure, eventually the price of the changeover will probably drop -- maybe to $500. The point is, however, that it shouldn't have to. $500 is the price they should be charging now -- and even that's excessive. They should properly be giving the damn thing away for the price of labor, since the price hike in the beginning covers what the upgrade should be costing now. But they won't. And by delivering yet another shaft to the long-suffering-but-loyal followers of the Macintosh, Apple has shown that, in the end, they're not that much different from any other computer company, that they don't really give a damn about the end-user, and that the final arbiter is, as we all suspected but hoped against hope was not true, the bottom line on the ledger books.

I guess 1984 is a little more like _1984_ than we might've hoped.

From The Rest of Us to Apple: one extremely loud and heartfelt Bronx cheer.

I'm looking for a pascal compiler for an apple III, but I'm really
not interested in paying the full price for a new compiler since
it will in all likely hood be used for only one program.

If any one can help me I would truly appreciate it.

thanks

 I have to disagree. You knew what you were getting into when you bought
your Macintosh. No one twisted your arm. And if you calm down for a minute
and look at the market price of chips (256K Drams), Labour, and of course the
money apple is losing in all those mother boards it has to rebuild, you are
getting a good deal for your $995. As I recall the upgrade was rumoured
to cost $1500 -> $1800 range. So count your blessings. I too have to fork
out the $995 to upgrade MY Macintosh, but for the added memopry, speed and
performance its worth it. If you wanted "perfection" you should have bought
an IBM-PC.

Oh, yeah, if you paid the regular price ($2495...) for your Mac, you also
get $250 worth of FREE software; MacProject and MacDraw as I understand.

    You really do have problems. I have transfered most ov my apsoft files
to PRODOS with no problems at all. It sounds like your problem is in
the CONVERT program, although mine doesn't involk trace it will sometimes
die in the middle of a transfer. The only thing I can suggest is to go to your
dealer and try a different copy of CONVERT.

[and gives its customers the shaft]

Hooray for Mike Conley for telling it like it is. Except that
he was a little to kind. He forgot to mention that if we had
all waited just a few months we could have saved ourselves some
big bucks. Here's a little arithmetic: right now I can buy
a 128K Mac for $2,000. That's a $500 discount from list. Apple
has dropped the price (effective someday) by $300. That means
we can expect to see the 128K Mac (the Tiny Mac?) (The inadequate
Mac?) selling for $1700. Add a thousand to that and you get
$2700. That's what I expect to see the Fat Mac selling for real
soon now. That's $200 more than I paid for my Meager Mac. That's
a hell of a lot of depreciation to see in just a few months,
just a few months after the product is released.

Just think how Apple would be doing right now if everybody had
been smart and played it safe. If everybody had realized the
truth - that Apple is just another greedy, screw the customer
corporation. (Even IBM does better - they put the screws to
their business partners. Apple does it to their custumers)
If everbody had played wait and see (like the folks who Apple
is now rewarding), Apple would be in deep trouble right now.
Considering that, before the Mac, the only thing decent thing
they produced was little more than a toy, and that they have
produced failure after failure - if the Mac had not sold well
that company would now be worth zip! And we who took Apple on
faith (the software will be out next month, next month, next
month), who believed that Apple was a little different have been
thanked in a very nice manner: "You've been stupid enough to
cough up the bucks so far - so why not be real stupid and cough
up some more".

Damn you Steve Jobs.

P.S. I've called Apple ((408) 996-1010), have you? I was rude.
P.P.S. What do you think of a guy who starts out robbing the phone company
     and ends up robbing his customers?
P.P.P.S. Is anybody going to be stupid enough to buy a Fat Mac
     at $3100?

Seems to me the loud complaints are coming from the people who
were too foolish to buy the computer they needed. I too thought
the Macintosh was cute but I couldn't figure out any way to
justify buying one. If a dozen good graphics adventures are
marketed for the "Fat Mac" I might buy one. Otherwise, it is
clearly targeted as a desktop accessory for the executive, not as
a hobbyist or home machine.

We all heard similar complaints when people jumped on the home computer bandwagon and bought some other machine that they had no justifiable use for, including Apple IIs. It is not the fault of the manufacturer that the computer does not meet your needs, although it might be the fault of the salesmen.

I find it hard to believe that Apple's mainstay is currently the Macintosh. Does anyone have accurate accounting figures on the various Apple products?

   <read a book today>

Does anyone have any experience with using an Apple II+ or IIe and the Saturn 128k ram card, and the Gibson light pen. My problem is loading the ram expand (ramexpa) program, from the BASIC diskette provided with the Saturn card, and the Gibson light pen software (Pentrak 1.1 or 2.0), and using these two utilities together. It appears that the ampersand hook in Pentrak interferes with the ramexpa capabilities in the Apple's memory (or visa-versa). How can I tell DOS 3.3 to load ramexpa and/or Pentrak 1.1 or 2.0 in a different place in memory so that the two will not interfere with each other. I am using Applesoft BASIC and I would like to stay with this language for my particular application.

I have tried to load the two programs at different times (ramexpa first then Pentrak and visa versa) but nothing has worked for me yet.   All suggestions welcome!

Unfortunately, the computer I need costs >$15K. I was foolish
enough to think that the Mac would come close without waiting
to see what it could really do. It now looks like the Fat Mac
will come close to being what is needed, but because I paid list
price early, I can't afford it.

Does anyone out there dial-up with an Apple II+ using the Apple Super Serial Card? I have an Apple II+ with the Super Serial Card and a Videx Ultraterm Display Card and I'm getting a blank line after every command I type in. I'm using the SSC in the Communications Mode, running in the Terminal mode (firmware). I think the problem is that in BASIC, <CR>'s are actually turned into <CR><LF>, but I'm not sure. Does anyone know a solution to this problem? I know it's not the Ultraterm, because I tried dialing-up without the Ultraterm and the same thing happened.

I was also wondering if anyone out there has a termcap entry for the Videx Ultraterm (or Videoterm). I'm having some trouble running 'vi' on my Apple. In particular, all the motion keys (h, j, k, l) work except down (j). The termcap entry I have now lists 'do=^J' which seems like it should work, but it doesn't. This may tie in with the above problem, but I don't know. I'd appreciate any help I can get.

From: Emil Rainero <emil>

I posted both programs to net.sources due to the large number (>30) of requests for these programs. While I have your attention, I should add that I have other utility programs for general consumption. Offhand I can think of the following useful programs.

B = Binary, A = Applesoft, I = Integer, P = Pascal

1. remove dos(B): Remove Dos from basic disk (frees up tracks 0-2), good for data disks

2. move dos(B): move dos to the language card, get another 12k of memory for basic

3. disk master(B): sort the files on disk, restore deleted files

4. esc catalog(B): allows you to exit a long catalog listing with the esc key

5. freecat(A): display number of free sectors on disk at every catalog command

6. make shapes(A): makes shapes, edits shapes, merges shape tables, in Hires

7. memory test(B): tests memory

8. motor speed(I): displays in LoRes the disk speed (slow ... fast)

9. magazines(A): general purpose data base program, useful for magazines I keep each magazine article (date, title, page, magazine, language, description) and then search for a particular procedure when I need it. Can handle about 500 articles. Very fast (machine) sort, search, string swap. (you may have guessed by now that I have written this one)

10. demuffin(B): opposite of muffin

11. cruncher(B): compresses applesoft programs, removes rems and intelligently builds long basic lines.

12. name disk(A): allows one to add a 11 character name to basic disks instead of getting volume. Eventually this will be incorporated into a global directory search to keep track of all programs on all disks.

I'll have to scrape up documentation for these if anyone wants them.
I'm not sure how to post some of these to net.sources. Some are binary files, other are assembly (Apple toolkit).

I'll have to take this list and run through my catalogs for other stuff (games, etc). Does anyone else have some useful utilities, games, other?

Emil Rainero

Lisa unix was ported by both Unisoft (UniPlus+) and Microsoft (Xenix).
The UniSoft port is easily available from UniPress Software (201)985-8000.
It contains the whole works (System V, C compiler, Berkley vi & csh, and
more for $1495.00 list. Played with the demo at a show for a few minutes,
it's real and quite usable ... will be nicer when Apple releases the
fast disk controller.

UniPress also offers SVS languages, RM Cobol, SMC stuff, Irvine ADA,
UNIFY, LEX WP, TOM Acct pkgs, RDB, VERTEX, Phact ISAM, and other
bussiness software for it. Also 25-100mb drives and tape.

There are plenty of lisa's around ... after the last price reduction
to complement Mac's they are pretty cheap for what you get.

(Have looked at trading my 11/23 XENIX in on one ... would be nice to
find a really cheap used one in good condition!)

The Apple II joystick is just a pair of potentiometers (variable
resistors) each of 150Kohm maximum resistance, arranged with a
mechanical linkage so that the stick turns one for motion in the
X direction and the other for motion in the Y direction. There are
also one or two momentary-contact pushbuttons. The connections
that need to be made to the joystick connector or peripheral DIP
socket are described in the Apple II technical reference manual.
You would be better off buying a joystick (both Apple and Kraft
make good ones) unless you just like to work with mechanical widgets.

I don't mean to ask the dumb question of the month, but -- I see lots of
references to AppleBus in info-mac; I could have sworn that the Apple folks
at the 1-day seminar (NYC in April) said a preliminary spec was available
(to be finalized by 8/84).

But I can find no reference to AppleBus, let alone a spec, in any of my
Mac literature (including Inside Macintosh + updates).

On a related topic, my Inside Mac (~1 month old) has any number of references

to the document "Putting Together a Macintosh Application." Sad to say,
no such document is present. I have not read every word of every document,
but when the clock strikes 13 it is time to take a closer look...

If I am going blind, please so gently inform. If not, can anyone supply
either of these things? If you have noticed other gaps, send me mail --
I can summarize and post and/or put in a "class-action" scream to Apple.
Thanks,

=Ned=

The actual use of the halt-and-branch is due to the fact that there were
two start buttons on the 1401: a simple resume and a reset-resume.
Neither cleared the program counter, but the reset-start would clear the
(suspended) branch (thereby continuing after the halt without taking
the branch). Thus the operator could transmit one bit to the program
by his choice of start button (no console, remember!).

I have a problem using the Apple as a dumb terminal at 1200 bits per
second. I am using a short assembly language program on an Apple
IIe that monitors the serial port and Apple keyboard port and
writes to the screen using the firmware routine at $FDED. The
problem is during CR/LF sequences several characters are lost.
I want to know if there is a different subroutine I should be using
or do I have to write my own display driver. Suggestions or comments
are welcome.

[HOO, BOY]

So, there I was, with the Font Editor newly in my possesion, having spent the last several months getting sick of not being able to tell the difference between a 0 and a O, or a I and a l. AHA, says I, I will edit the Monaco Font and cross that zero and serif that I. So I did. Then I tried to install it in the system file. OOPS, Monaco 9 is a system font. Can't remove it with the Font Mover. So I removed it with the Resource Mover, then used the Font Mover to put the new font in. Started feeling good. Then I noticed that the System File I was using was one of the old ones. No Matter, says I, I will just do it again on one of the New System Files. Ho HO. It seems that the Resource Mover will not allow you to modify the System FIle if you happen to have booted with the new System File. So I booted under the old System File, renamed the new System File, removed the Monaco Fonts, renamed it once again "System" and stuck the new fonts in.

Here are the steps:

Copy the font editor, resource mover, the new System Folder, and the fonts file that came with the new System Folder to a work disk.

enter the Font Editor, edit the font(you gotta figure that one out for yourself).

install the fonts (I did Monaco 9 & 12)

exit the Font Editor

trash everything except the system file, the fonts file, and the resource manager - empty the trash

DUP the System disk

Reboot with another disk as the startup disk

rename "copy of System Disk" as "foo" (or whatever) (can't do this without the reboot)

copy *OLD* System file and Finder from another disk

reboot with work disk as startup disk

use resource mover to clear Monaco fonts from "foo" (Monaco fonts are 512, 521, & 524)

exit resource mover

reboot with some other disk as startup disk

trash system file on work disk - empty trash

rename "foo" as "System"

Use Fontmover to move new Monaco fonts into System

reboot from workdisk

copy System file to destination disk

test with macTEP and Macwrite

jubilate

copy System file to *ALL* your disks

Notice that Macterminal is still using the old font (I just now noticed)

Back to the resource mover...

>>>>>>NOTE<<<<<<<<<
The utilities from the software supplement may work great on a Lisa (don't know, don't got one) but on the Mac, they have a way of crashing the system and/or trashing the disks. SO, don't use them on anything valuable, and BACKUP, BACKUP, BACKUP!!

Disclaimer: There is no guarantee that this procedure will work for you. In fact there is no guarantee that this procedure worked for me. All I know is that I can run MacTEP (and expect to run Macterminal) and see crossed 0's and serifed I's. If you have any problems, give me a call, and let's talk about it.

[]
The "Monaco" font resources in Macterminal 0.15 are numbered -16375 & -16384
To replace them, renumber them, move the Monaco font resources numbered
521 & 512 and renumber them -16375 & -16384 respectively.
Remember that -84 is smaller than -75.
Every time I tried to get rid of the old fonts, the resource mover would
crash, ruining the macterminal file. So I just left them there with "random"
numbers.

 UL battLE   UM bottOM   UN buttON   DX  baTTer   Q glottal stop
 - silence

 0 to 9 as a single digit can be entered after any vowel as a stress marker.
       Stress alters pitch, intensity and length of the vowel.
 # ends the whole utterance.  As it silences the sentence in which it occurs,
      it usually follows a period.
 Parentheses () seem to get the words inside them to be spoken as a continuous
      group, rather than having a tiny gap between words.
 Period and comma indicate different pauses and intonation contours,
      appropriate to their normal punctuation usage in sentences.

```

Does anybody knows how to interface the Mac to Vax 11/780
(Unix 4.2BSD) without the use of a modem?

Can I just connect the RS-232C from the Vax 11/780 to
the Mac?

A friend of mine is considering buying a Lisa or MacIntosh. He's
a business person, knows nothing about computing, and wants the
usual word processing, spreadsheets, graphs, database stuff. I'd
like to hear from people with first hand experience with the
Lisa: Is it easy for naive users as the Mac? Is the Apple
software all top quality? Is there any good software for Lisa
other than the standard package? Major problems/regrets? Would
you take it over the Mac if $ weren't a major factor?
mail replies to -- henry@rochester
Thanks.

I acquired from SUMEX through a friend the "freeware" text editor
called FILE, in .dl (tohex) format. It is very useful for general
editing as opposed to word-processing. It even can be used to make
MacTalk documents. Since it was not generally available to Usenet
readers unless they could FTP from SUMEX, and has no distribution
restrictions, I have posted it and an associated help document
to net.sources.

I have tested it only very briefly (downloaded, ran fromhex on it,
fired it up and did a bit of editing), but there seems no reason
to believe that it does not work as advertised. Try it!

Thanks to John W Peterson for making the program available.

I have seen ads for new drives with a megabyte of disk capacity. (Made by Teac
and Mitsubishi). They claim they can work with existing controllers. They use
something called the J format. Has anyone else ever used one of these things
before. Has anyone ever used one with an Apple before? All responces would be
appreciated.

Does anyone know whether any version of MacTalk is or is not redistributable?
It appeared on the same disk as the original of the text editor known as
"File", which is public domain, and is by the same author, so I wonder
if it is also freely redistributable over the net. Several people
have asked.

> P.S. Could someone help me with Font Editor and Resource Mover? I have
> edited Geneva-12 but get crashes when I try Geneva-24 or New York-36.

The Mac runs out of memory after fonts reach a certain size. When I tried
to install New York-36 I got a System error 25, which means out of memory.
New York-36, according to the font mover, is over 13K. If I had to edit
that font, and didn't have a Lisa, I would break it into two halves and
give each a half-name like New Y-36 and N York-36 (I haven't tried this,
it's just an idea).

Does anyone have a copy of mFinder. I have been using mine and it works
fine for launching applications on the same disk as mFinder is on. When
I try to launch an application on a disk other than the original mFinder
disk, the program gives me an ID=26 error system crash corresponding to
a bad program launch. Any hints anyone? Mail me and I'll post
summary.....

One further note: If you're content with no color and some black space
above and below the display, a PAL monitor will do fine. I had no problems
running the apple and drive all over asia at 50 hz. Contrary to a recent
(rather nasty) reply about printers I also had no problems running several
60hz printers during a period of two years at medium duty (50-100 pgs/day).

    Public domain software is now available from:

        Computer Learning Center
        P.O. Box 45202
        Tacoma, WA 98445

    They accept check, money order, VISA/MC.
    Price is $4/volume. WA state residents add 7.8%.

    (This appears to be another branch of the group that
    publishes Hardcore.)

    The free catalog I received lists 97 in categories
    such as Apple Tutor, Art/Graphics, Astronomy,
    Aviation, Business/Finance, Chemistry, Electornics,
    Games, more Games, Math & Stat, Music, Passion!,
    Utility. Also, there are another 65 volumes of
    EAMON adventures (my favorite).

Has anyone run macget successfully on a V7 system? I have converted
macput (details below) and it is just fine, but macget transfers an
undetermined number of packets before getting to a state where it
does 10 retries and then hangs up (kicks me off the UNIX system).
Sometimes I can transmit 4k (at 300 baud), sometimes zero.
On the 4.2BSD Vax, macget works perfectly as far as I can tell.
It is on the Perkin-Elmer 3242 (32-bit machine) and the PDP-11 (16-bit
machine) under V7 that this indeterminate behaviour occurs.

I have tried setting the file transfer parameters in MacTerminal (-0.15x)
to put various time gaps between lines and between characters in case
the problem was the V7 system getting behind, but it makes no difference.

Changes made to the 4.2BSD version:
Line 4: #include <sys/ioctl.h> --> #include <sgtty.h>
Add: #define rename(x,y) link(x,y);unlink(x)

(The above change macget to its state on the 32-bit Perkin-Elmer,
and are the changes required for changing to 4.1 also, according
to utzoo!peterr)

For the PDP-11, a couple of "int" declarations had to be changed
to "long". These are in struct macheader, m_datalen and m_rsrclen

Changes to macput.c that seem to work are parallel:
change sys/ioctl.h and (for 16-bit machines) the declarations
of macheader.m_datalen and m_rsrclen. Also, the last function
in the listing, put4, requires "value" to be declared "long"
instead of "int". "rename" is not used in macput.c

The July-August MacWorld contains a picture by someone who says part of it
was created by flipping a copy of an image vertically. This is something
I've unsuccessfully tried to figure out how to do. How is it done?

Consider these two short pieces of 68000 Assembly language:

(1) 1000 MOVE.L #$04001008,A0   (2) 1000 JMP #$04001006,A0

```
    1006 JMP (A0)          1006 LEA *-6,A0
    1008 LEA *-8,A0             ...
    ...
```

One would expect (at least I did) A0 to contain the same value after both LEA instructions. Reality on the 68000 (I tried it on a LISA and a Mac) is different, though. In case (1), A0 contain $04001000, and in case (2), A0 contains $00001000. I find this behaviour inconsistent. Apparently, the program counter actually gets set to the 32bit number in the first case, whereas only 24 bits are used in the second case.

This feature is particularly noticable on the LISA and the MacIntosh, on which most addressing is done PC-relative to make code position-independent: PC-relative instructions use the whole 32 bits of the program counter, and PC-relative jumps and jsr's preserve the highest 8 bits, so that any setting of the 8 msb is preserved through long sections of a program. The LISA/MacIntosh debugger, MWLB, however, clears those 8 bits. Altogether, this can create pretty obscure bugs.

[The way I discovered this feature was when working on my "Infinite Improbability Lisp Interpreter" for the MacIntosh: certain functions called by the evaluator failed mysteriously, but only if they did not contain debugger trace points. The RTS instruction at the end of these subroutines restored the program counter to normality... If one of these functions called the panic routine, though, all of a sudden the reader and the interpreter would not recognise LISP anymore. Maybe I should have chosen another name for the thing.]

You can connect the RS-232 port directly to the serial port of the Mac.
Of course you'll need a special cable (as if there were such a thing as

a standard RS-232 cable). Use the pinouts found in macTEP, but swap
pins 2 & 3 on the DB-25 side. You might also have to connect pin 2 (+5v)
on the DB-9 to pin 6 (Data Set Ready) on the DB-25. As in all cases when
connecting two devices for the first time, be prepared to experiment.

(null)

Does anyone out there know how to get raw mouse input for the Mac?
The OS calls give you the cursor position on the screen, but if the cursor
is on the left hand side of the screen and you move the mouse left, no
movement is detected. I need the delta x & y info. Alternatively, is there
a way to set the cursor position? The toolbox stuff says there is no
easy way; how about a difficult way?

This is in reply to my own query about letter-quality printers
for the Macintosh. Since I wrote my article, I learned
1) 47th St. Photo offers a cable to hook up the Mac to a
   Brother printer. The adapter costs about $100. I know
   nothing about it.
2) TTX Incorporated, 3420 East Third Ave., Foster City,
   CA 94404   (415) 341-1300, sells a daisy wheel printer
   (claiming 12 cps at 10 pitch) and an adapter for the
   Macintosh. I have not seen it in action and have no idea how
   good it is.

Lines: 33

The PCPI Appli-Card(tm) is a versatile CP/M(tm) card for
the Apple II (or IIe). Using the OEM software that can be obtained from
PCPI, one can write special purpose "drivers" that down load into the
Apple at boot time. The card comes with a standard set of drivers for
controlling the console, printer, etc. Supposely these drivers can be
relocatable or can be loaded into an absolute location at boot time.

Now to my question for those of you who have a PCPI Appli-Card...

I have been able to write a relocatable driver that allows one to call a
subroutine in the apple. Yes I know that there is a general command for
doing this, but sometimes values have to be placed in the X, Y, and/or A
registers before calling the subroutine (eg., calling some of the
graphics subroutines in the Applesoft ROMs)--and that's what my driver
does.

My question is: I am trying to make the driver so that it loads in an
absolute address (eg., at $4000 just above Hi-Res page 1). I cann't get
it to work--my system hangs when I boot it with this driver installed as
an absolute loading driver (It works great as a relocatable driver.).

Can anyone give me a hint???

     Thanks!

I haven't found it necessary to alter the pin connections. The same cable
works fine. Maybe it is a question of selecting the right "Communication"
parameters out of the "Settings" menu in MacTerminal. Use "Other Computer"
rather than "Modem".

> marvellous machine in the August (I think) issue of Computing Now!.

What they describe is truely a great machine. It can be just about whatever you want it to be. Plug in a 6502 board and it is an Apple, moreso than a lot of the lookalikes/workalikes/clones etc. It supports all of the Apple calls to monitor routines (Also runs Zaxon which apparently the clones don't do so well). Plug in an 8088 and you have an IBM PC that runs like an IBM. Or run the software that has been designed for it.

Obviously, you pay the price for this technology, you could buy an actuall Apple or IBM PC for less than the Dimension but of course then you wouldn't have the versatility.

[manges-moi]

I have not heard much about other communications programs for the][+,
but having used ASCII Express Pro for awhile I can say with relative
safety that you probably won't find one that is more versatile: file
transfers (both "standard" and Christensen), keyboard macros which can
be hacked into some form of auto-logon, good interfacing woth most
80-column boards and serial cards, etc. It gets my vote.

Richard Johnson   {dual,mtxinu,nsc,voder}!apple!richard

Using the high 8 bits of addresses for flags or other data was
traditional wisdom in the '60s on the IBM 360 but eventually it burned
them. In the '70s when 16MB virtual wasn't enough, they built hardware
that had 31-bit addressing, but it took ANOTHER 10 years (no kidding)
to convert all the software so they could turn the hardware feature
on.

Luckily for most of us we knew when it came out that 24 bits on a 68000
was not enough and avoided playing kludge games.

Don't mess around! An address is 32 bits, and if you depend on the
hardware to ignore the top N bits you will be burned within two years.

Now, the behaviour decribed (68000 jmp long absolute loses the top 8
bits of the jumped-to address) is certainly a bug if it's true. But
your code should never notice since it should never use those bits.
The 68010 chip (which when packaged as a 68012 has 31 address bits)
does not have the bug. I'm sure the 68020, with a 32-bit address bus,
doesn't have the bug either. I don't have a 68000 around to verify
whether current rev 68000's have it.

     Hi.

     Somewhere, I read about a simple modification to the
Apple II (maybe also II+, IIe, or IIc) that effectively doubled
the horizontal screen resolution for Hi-res graphics. The general

idea was somehow tying the vertical (or horizontal ???) retrace
signal to the 'bit' that selects page 1 / page 2. After making
this modification, which I vaguely recall involved a single
jumper and perhaps a single trace cut, the two 'pages' would
automatically flip upon each vertical (I think) retrace. Although
other effects are also possible, the particular effect that I
was interested in was the above-mentioned doubling of the
horizontal resolution for graphics. All pixels on one page are
done with bit 7 low, and on the other page with bit 7 high (thus
causing the half/pixel horizontal shift. I am not particularly
hardware oriented, although I'm not a complete idiot either. If
anyone knows how or can figure out how to perform this (possibly
warrenty voiding - horrors) modification, could you please post
it to the net or mail it to me directly. In return, I would be
glad to submit (once working) source to replacement 6502 routines
to allow Applesoft (or whatever) to take advantage or this
capability (these routines are fairly easy to write). Thanks.

The 68000 does not lose the upper 8 bits of the
address. Internally all 32-bits are significant on the 68000 regardless
of whether there are 24, 31, or 32-bits of address visible from outside
the chip. The implementation internally is the same for all cases.
I agree completely with the description given by John Gilmore as to the
motivation for not mucking with the address.
It seems highly likely that the culprit may be a program playing games
with those upper bits, it's not the processor.

Does anyone know where I can find a copy of one of the CP/M
"X-protocol" MODEM programs for an Apple II+ with a SoftCard?
Better yet, does anyone have enough experience with this
combination to offer any application hints?

Obviously, without a file transfer program I need a copy
on an Apple-compatible 5-1/4 inch disk.

Thanks!

This problem of loss of the first few characters also occurs with
some 80 column cards and also the BASIS 108. The reason is that as
the screen scrolls after a new line at the bottom, a few characters get
lost. Often the first character is received and repeated, with the 2nd
and a few more chars lost.

The solution for screen problems is to tell UNIX to do a
stty nl2
You may need to do a stty cr2 for the printer.

Doug MacGregor (Motorolas) writes: 'The 68000 does not lose the upper 8
bits of the address'.

Well, my 68000 *does* seem to loose the upper 8 bits when loading an absolute address from memory. Again, consider the following code fragments (they were run as such under LisaBug, and the register contents are what LisaBug reported):

```
1000: 4ef9 ff00 1006    jmp $ff001006
1006: 41fa fffe         lea *,a0

     a0 = $00001006

1000: 227c ff00 1008    move.l #$ff001008,a1
1006: 4ed1          jmp (a1)
1008: 41fa fffe         lea *,a0

     a0 = $ff001008
```

Or is there another explanation?

Thomas.

P.S.: About choice of implementation of type tags: given that the LISP runs on an MacIntosh with very limited memory resources, given that the Mac has a "fixed" architecture and is unlikely to profit from Motorola's corrections to the 68000 (as in the 68010), and given that the LISP performs very well speedwise, I think the choice of putting type tags into the "unused" msb of pointers, and not explicitely stripping them before dereferencing (except for the case of indirect jumps :-) is justified. Since all type reconisers and selectors are defined as macros, this efficiency hack even leaves the program portable. Normally, I prefer partitioning to tagging, but in the case of the MacIntosh there isn't much choice.

If it hasn't been done yet, could someone post the list of bugs fixed
by moving from Apple 1.1 to Apple 1.2? Thanks in advanced.

Right now I'm wondering if this program would compile under 1.2 as
it will not under 1.1.

```
PROGRAM TEST;
TYPE REGISTER = PACKED RECORD
           A  :0..7;
           B  :0..3;
           C  :0..1;
           D  :0..3;
         END;

VAR
  Q  :REGISTER;
  I  :INTEGER;

BEGIN
  MOVELEFT(Q.A, I, 1);
END.
```

Changing the Q.A to simply Q will work on 1.1.

I am writing a book about ProDOS on the Apple //c, and am
interested in:

o   Comments about ProDOS

o   Information about quirks or other sources of anxiety

o   Opinions on current documentation, including anything
    not necessarily put out by apple

o   Interesting inovations

o   Miscellaneous information or comments about the //c

Any input would be greatly appreciated.

How does MacTerminal tell the host where the cursor is at?

If when you position the cursor with the mouse a bunch of arrow key sequences
are transmitted relative to where you were, it would take quite a while to
tramsmit, (2.6 sec worst case at 1200bd). This would have the
advantage that TERMCAP understands what the arrow keys are, and would
be usable on most programs.

Another method would be to let the user move the cursor locally, and REQUIRE
the host to ask where the cursor is at when it matters, (\E[6n for a vt100).
This method is much faster and cleaner, but rewrites to programs would be
necessary.

The final method would to have MacTerminal send an escape sequence,
(\E[Pl;PcM or something) when he/she releases the mouse button at
a new cursor location. This is probably the best, but again, TERMCAP
does not support cursor entry of this sort (as far as I know); and
rewrites would be necesary to editors.... .

I do not have access to the new Beta MacTerminal yet, but I would like
to know what thoughts there were on a standard way to "mouse" the cursor
on screen driven programs, and how MacTerminal did it.

Well, if your Lisp is worth its salt it will survive the Mac. What would prevent its running on, say, a Sun? The problem is not that you're depending on 68000 bugs, it's that you depend on a 24 bit address bus. Various commercially available 68000 based systems provide anywhere from 20 bits to 32 bits of addressability. Given a network of machines (linked by AppleNet or Ethernet or whatever), why should there need to be N different copies of your Lisp, based on the address bus size of the machine that wants to run it? (The source may be portable but the binary isn't.)

Also, I've heard rumors of a "Big Mac". Given that Apple seems to like the 68000 family, they might make a machine with the faster 68020 once it's available in large volumes. Of course, if too many people write software like yours, they won't be able to offer binary compatability with Mac programs. Reminds me of the people doing the 16-bit 6502 chip who had to put the 6502 bugs back in because all the Apple][programs depended on them...

The "double-density" hi-res mode is a hardware feature of the Apple //e.
No modification is required. All you need is the Apple extended 80-column
board (the one with 64K on-board memory, for a total of 128K). Double
density probably also works with the Apple //c, but I can't say for sure.
It definitely does not work with the II+, and there is no simple hardware
modification that will make it work.

One exception: If you have a //e with a "Revision A" motherboard (manufactured
within the first month or so after the //e was released) you may need a
hardware modification, which your Apple dealer will handle for free. You
must have the Extended 80-column board in order to get the modification.

The only software I have heard of which makes use of double-denity hi-res
graphics is Apple Pascal 1.2. The Apple //e Reference Manual and the
Extended 80-column Card User Manual describe how double-density mode works
(i.e. what soft switches to set, and how the memory is mapped).

Availability of the SUMACC programs is not so much a matter of whether one
is in the Consortium or not. Rather it's a question of whether or not you
have access to an Arpanet (or Internet) site. The programs are in a
preliminary beta test-like state. Consequently no arrangements have been
made for wider distribution of the programs.

For reasons much too long to explain here, we have been off most of the
network for several months. I would very much like to obtain a copy
of all articles relating to Apple's Lisa and MacIntosh systems. If
there is anyone who has achived these, please let me know so that we
could try to arrange for a copy. Thanks in advance.

Such problems are common with apples. I have ALWAYS (5 years) been
able to fix them by a one or more of the following techniques:

Let it cool off. If heating is the problem, buy a fan. The fans inside
the computer do not work. Get one of the ones that hang off the side.

Push on all the chips. They often work a little loose. You have to
push pretty hard. The risk is that you will crack the mother board. I
have not done that yet.

Pull out your disk controller card (and/or other cards) and clean off
the little gold contact fingers with an eraser. Make absolutely sure
that the power is off. I got frustrated once pulling boards and managed
to pull one with the power on: goodbye motherboard.

You may be lucky to get someone who knows what they are doing at a
computer store. The time I blew my motherboard, it took ComputerLand 4
weeks to get it fixed. I think I knew more than most of thir repair
people, and I don't even know the names of the chips, let alone what
they do. A big part ofg the problem was that they did not listen to
what I problems were going on, or did not check to see if it was gone
after they had a second (and third, and fourth) shot at fixing it.

Looking for Apple peripherals, new or used.
Will purchase within two weeks.

1. Digitizers
visual, mechanical and tablets
2. Graphics board
3. Printers-
Epson RX-80
Epson LQ-1500
interface cards for above printers
robotics control card
Videx Enhancer strip
Macpaint program for apple II+ (original program only)
Mouse to fit apple
Video digitizers (standard video or whatever)

 will acquire these by September 1, so
if you have one of these items kicking around, new, used,
dead, alive, or whatever, you can bear tp part with and want some
bucks for it, please leave me E-mail or call me at

I would like to use my new Macintosh system as a terminal (on a Unix
system), if possible both as a standard alphameric terminal and as
a graphics terminal. Ideally, I would like VT100 and Tek 4010/14
emulation. I would also be interested in upload/download software
for MacPaint and MacWriter files. Does anyone out there know
anything about what's available and where to find it?

I strongly suspect that much of this has already been discussed in
this group; if so, please don't hesitate to send me a summary of what
has transpired by mail instead of rehashing it on the net.

Thanks in advance,

Ed Turner

this is a really slick modification for converting an apple
II+ to upper/lowercae control. I didn't think of it, I just
use it. Anyway, run a wire from the shift key connection on
you keyboard (as you are standing over the front of the
computer, this is the second connection from the right) to pin
#12 on the game I/O socket (again, standing above the comuter
ad looking toward the back, this is on the right side of the
socket, fourth from the bottom). That's it. Every time you
hit the shift key, it sends a value to the game AN connector
(on/off). Software can read this location, if it is high, it
massages the ascii value from the keyboard to uppercase.

    Note: you must have software that looks for this. Can't
    recall adress at moment, it is in the Apple reference
    manual. Magic Window II supports this modification.

.
There is an interesting software hack that I invented that will do a similar function for you. It flips back and forth between the Apple][(+) hi-res pages 0 and 1 exactly at the end of the video refresh scan. This then allows both page 0 and 1 to be displayed (pseudo)-simultaneously.

The big problem is that due to the way colors are generated (with the bit-7 phase shift), blended colors tend to wash out so that the new colors are only white-washed colors (more white-ish) versions of the normal colors available.

Other problems are display flicker is noticeable (entire screen refresh now takes twice as long) and software overhead can be substantial because it must poll-wait until the exact end of screen.

Here's how it's done:
Apple][dual-ports memory between the CPU and display (cycles between the two are interleaved). If the CPU attempts to read from a memory address that does not contain a device, the CPU ends up receiving whatever garbage data happened to be floating on its data lines. Because the display access was the last cycle to occur, these data lines then retain the display data. If a certain pattern is placed in display memory only at a certain point in the display, software can wait until this pattern is displayed by repeatedly reading non-existant locations and comparing. A simple polling loop is:

```
      LDA pattern
Wait  CMP $CFFF     ;no device is addressed at this location
      JNZ Wait
```

Once the pattern is found, then the software can flip the hi-res page and do a little useful work before it comes back into the wait loop. Note: place the display data pattern in the display several times in a row (atleast four) to guarantee catching it with the compare.

.
If you have any plug-in cards in your system, remove them to see
(by process of elimination) if any one card is causing the problem.

Try your system with no cards (comes up in BASIC, does it work?)
Try booting with only disk controller card!
etc.

Sometimes there may be no problem with any one card but the combination
of all the cards in the system draws too much power or creates too much
heat.

***
Question (prompted by a Byte article which reviewed Turbo Pascal for the PC...):

The artical was in last month's issue, but it referenced another from Jan, 1983. In that one, Byte listed benchmark times for the Sieve of Eratosthenes for many machines, as reported by their readers. (The Sieve finds the prime numbers from 0 (1) to 8190, and does this 10 times, I believe.) In that Jan, '83 article, there were 2 reportings for Apple Pascal (on a][?), which differed by more than a factor of 2; I tried this with the program given in last month's article and got results that were slower than the slower of those two reportings by a factor of 1.5 or so. So, what explains these differences?

(1) Perhaps the other readers were guilty of biasing their results.
(2) Perhaps they had Accelerator boards or something, but Byte didn't report it or wasn't told.
(3) Perhaps they optimized their programs or their algorithms somehow.
(4) Perhaps there are differences between Pascal 1.0 and 1.1 (I tried this with both 1.1 and 1.2 and got identical results).
(5) Perhaps there are differences between the][, the][+, and the //e (mine).
(6) Perhaps this reflects loose tolerances in the 6502's clock speed, and mine is slow.

[There was some discussion in Byte about optimizing the program (especially for different languages) or the algorithm, but this strikes me as invalidating the whole concept of benchmark comparisons, a messy business anyway.]

Are there any intelligent comments to be made about this? I am curious about the timing differences, and the performance of my machine in particular. I am not inviting discussion of the general topic of benchmarks, but it just seems to me that almost identical machines running the same source code compiled under the same operating system with the same compiler should execute in about the same time...unless everything really isn't the same...

Hi.

A while back I submitted a question regarding a hardware modification to the Apple][(not-e, not-c) to automatically 'synch-up' page flipping between the display pages. I wanted to thank those of you who responded to me (and to the newsgroup).

Unfortunately, I'm not sure a got across exactly what I am looking for. I am not looking for any hardware or software products. I am looking for someone who knows what pin of what chip to connect to what and/or what run(s) to cut to accomplish the desired modification. My understanding is that this is a very simple mod for 'those in the hardware know'.

I will be eternally grateful if anyone can help me out in this. Thanks again. (By the way, I couldn't find the Don Lancaster book 'Enhancing your Apple][' that some kind soul told me about).

Chuck Heaton

***
I have been using TERMEXEC for 6 or 7 months, and have generally been happy
with it. It has unattended file transfer (receiving long files requires
the host to honor XON/XOFF, of course), a system for creating macros, and
an editor for editing any text file. The editor is not the fastest in the
world, but is is quite useful, especially since it handles <CR>'s and ends-
of-lines the way a typewriter does, rather than the way a word-processor
like Applewriter does. It also comes with an enhanced DOS and scrolling
capability. I have not really taxed its features other than the editor
and the file transfer. The company has been very helpful, and they do
maintain an online bboard, which offers some downloadable programs, e.g.
one to do XMODEM. TERMEXEC does not do smartterminal emulation, and there
are (apparantly) only tentative plans to work on it. One final feature, it
will do filetype conversion,from any type to any other type (Applesoft,
binary, text, Integer) so you can use it to transfer of any file (say an
Applesoft file) by transforming it to text, then sending it; this makes it
a good programming tool to, since an Applesoft file can be transformed into
a text file and then edited and worked on etc, then "exec-ed" bakt to
Applesoft to be re-run.

**
Someone had asked about bug fixes in Apple Pascal 1.2...

>From the Apple Pascal 1.2 Update Manual, Appendix A:
I. Compiler bugs

1) Regular units using (*$R segname*) or (*$R unitname*) are now linked properly.
2) if Compiler Resident option ($R) was used on intrinsic unit which had a data segment, the code was loaded first, so the datahad wrong addresses. Now the data is loaded first.
3) Exit(procedurename) didn't work if the procedure was a regular unit with number > 127. Now it works.
4) Initializations in nested units were executed in reverse order. Now the order is correct.
5) If (*$R segname*) or (*$R unitname*) refered to a nonexistent segment or unit, no error message was given. Now it is.
6) If an intrinsic unit had the same segment number for code and data segments, the Compiler did not give an error message. Now it does.
7) The Compiler did not check for an empty data segment in an intrinsic unit. Now it does.
8) Error message #350 (if an intrinsic unit needed a data segment but none was declared) was issued at the end of the initialization section. Now it comes at the start of the implementation section.
9) If a procedure was declared FORWARD but not defined, the error message did not stop compilation. The error could therefore be overlooked unless the operator watched the screen closely (no codefile was created however). Now the compilation stops and the error message displayed.
10) The Compiler could release heap symbol storage space too soon. Not now.
11) Negative long integers were treated incorrectly. O.K. now.
12) Compiler did not check for any constant string longer than 80. Now it does.

13) When a listing was turned of, the Compiler still issued a FormFeed when it saw a (*$P*). Now it doesn't.
14) Random errors could show up with identifiers that began with the letters H, J, K, Q, X, Y, or Z. O.K. now.
15) If several compiler options were issued in a single statement, the Compiler would ignore any that followed $S++. Now it doesn't.

II. Assembler bugs

1) .ALIGN was handled incorrectly. O.K. now.
2) If there were no symbols, the Assembler would print a garbage symbol table. Now it doesn't.
3) A fixup to a word that crossed buffer boundaries would destroy the byte following the end of the buffer. Now it doesn't.
4) The Assembler did not test for nested macros (illegal). Now it does.
5) An .ENDM without a corresponding .MACRO was not printed, and a wrong error ("undefined label") was issued. O.K. now.
6) The Assembler could overwrite SYSTEM.PASCAL if there were more than 10 procedures. Now it doesn't.
7) .INTERP references were relocated incorrectly. O.K. now.
8) If an .INCLUDE statement had garbage after the filename, the file was not included. Now it is after the error message is issued.

III. Linker bugs

1) The Linker sometimes failed handle DEF's and REF's properly to see if the labels of two assembly routines matched. Now it checks.
2) Regular units could not use segments numbered 16...31. Now they can.

IV. LIBRARY.CODE bug

1) If a library file being built exceeded 200 blocks, the interface text sections were not copied into the file. Now they are.

V. LIBMAP.CODE bug

1) Interface text of units that started after block 200 in the library were not reported. Now they are.

VI. SEEK/PUT bugs

1) Dynamically extending a diskfile, by SEEKing past the last block and then PUTting, could overwrite the next file, if the next file started right after the previous one. Now, if there is not enough space to PUT the record, the PUT will get an IORESULT of 8, "no room".
2) SEEKing a record number to expand a file, when there was room in the last block, resulted in a record being written after the former last record. Now the file expansion is tried first, and an IORESULT of 8 is issued if necessary.
3) Seek went to the wrong place whenever it wanted a position between the current EOF and the EOF at the time of the last RESET. Now the correct block is used for the buffer and the pointer is positioned correctly.
4) A SEEK to a large record number in a file with a large record size could take too much time. This has been substantially reduced.

VII. I/O bugs

1) If a driver was attached to a unit number 4...12, UNITREADs and UNITWRITEs would work okay, but file input or output by volume name might not. Now it will.
2) Floppy disk routines disabled interrupts, and left them that way. Now they are re-enabled after disk routines are done.
3) A WRITE of a null string did not set IORESULT properly if it was non-zero before. Now it does.
4) RESET or REWRITE on a DOS volume did not return an IORESULT error. Now it

gives a value of 10, i.e. "file not found".

VIII. Turtlegraphics bugs

1) Parameter YSKIP in procedure DRAWBLOCK did not work. Now it does.
2) DRAWBLOCK did not work correctly if part extended outside the viewport. Now it does.

IX. Miscellaneous run-time bugs

1) If (*$NR*) option refered to a unit that had an assembly procedure in its interface, and that procedure was called from outside the unit, the segment's memory was not released when the procedure terminated, thus occupying memory unnecessarily. If repeated calls were made to the procedure, memory could fill up with copies of that procedure's code. This memory is released properly now.
2) Repeated Control-A's during compilation or disk i/o's could crash the system or causde bad disk writes. Not now.
3) If "ignore external terminal" flag was set with RTSETMODE, any card in slot 3 was initialized, even though it was not used. Now it isn't.
4) A random character could be written in the last position of a real number if the field was wide. Not now.
5) An error in a long integer computation caused the interpreter to go into a loop. Now an error message is issued.
6) There was no check for stack-overflow when intrinsic-unit data segments were loaded onto the stack. Now there is.

Pascal 1.2 offers several enhancements to take advantage of the features of the Apple //e. It also has an enlarged error message set, an improved FORMATTER program, additional block volume units, a new operating system swapping option, a "same volume name as executing program" prefix for file names, and a new REMSTATUS procedure to poll I/O on slot 2. Finally, it offers a "128k" system for machines with extra memory; this is obtained by replacing SYSTEM.APPLE and SYSTEM.PASCAL with new versions provided. This space is used to hold p-code. (Actually, the "language card" space in the aux.mem. is "reserved for future use" so it isn't really a full 128k ram system.) There appears to be nothing lost by using this system at all times (this is what Apple says, too); there is no apparant increase in either running or compile time. The 128k system allows some enhancements in library file usage and it allows more segments, though they generally have to be from intrinsic units.

>From the Addendum to the 1.2 manual, it appears that the bug which held up distribution was that if the 80 character wide screen was used with the editor, and a character was written into the last column in line 24, it could damage the file. Apple's solution was to recommend changing the MISCINFO file to use only 79 columns on the screen. The value apparantly could not be changed in the MISCINFO file for a //e, so they provided another MISCINFO file for the //e which uses 79 columns. The obvious problem with this approach is that some application programs might really want to use 80 columns, e.g. a terminal emulator (?). The solution seems to be to use the 80 col. MISCINFO file on a startup disk intended for that program's execution, but to use the 79 col. MISCINFO file for any program development.

All in all, 1.2 seems to be a very nice package, and a real improvement over 1.1. Have fun.... Jim Muller

I am contemplating upgrading my apple][+ to a 1200 baud modem.
I have a couple of questions:

- Can the apple keep up? Is anyone currently running such a configuration?
  My current modem software is written in FORTH. Can FORTH on an Apple keep
  up? I also do a fair amount of keyboard/screeen translatin to handle full-
  ascii.

- Any leads on a good, cheap serial interface card for the][+?

Please resond via mail.

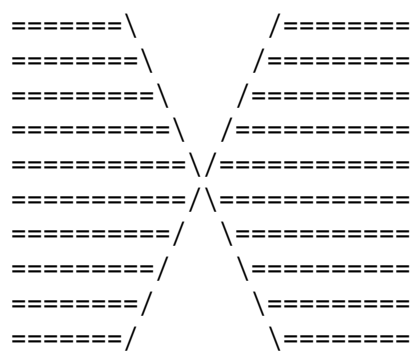
I have finally gotten around to responding to the question posed as to whether the APPLE II,II+.... could generate lower case. Most people responded with the popular "one wire" mod. This works fine AS LONG AS THE PROGRAM IS DESIGNED TO USE THIS FEATURE. What happens if you want to use lower case with a word processor that supports real shift keys, or an applications program that doesn't support the one wire mod. Weeellllll, it is very simple if you have the "two piece" keyboard. When Apple designed the II+, they fully intended it to have lowercase. However, they realized that this would make the II a competitor with the III so they decided that the major selling point of the III would be the fact that it supported lower case. BUT, the pc patterns were already made up, so they merely modified them a little. Look at the encoder board. You will see a location which looks like:

* *=*

* *=*

Or something like that (this is from memory so you'll have to be a little creative when you look for the pattern.) Anywaaaaaayyyy, look for a series of traces that looks like a double pole, double throw switch could be installed. cut the traces shorting the pins together- they look like



They are expanded for clarity. they really are about this big: =><= Cut these traces and install a switch. In one position your keyboard will generate lower case (you will have problems with generating an '@' (at sign) because a shift P will give you c a capital P. flick the switch to the other position to get keys like this] ^.......) while in the other it wll generate upper case only. NOTE THIS DOES NOT, I REPEAT NOT, DISPLAY LOWER CASE, IT GENERATES IT. If you have a lower case character ROM, then you will have no problems. otherwise, you will see funny things. If there is sufficient demand, I'll post the contents of a lower case prom.

I TAKE NO RESPONSIBILITY FOR THIS MOD AS IT WILL VOID YOUR WARRENTY (if there still are any valid II warrenties out there) AND A DEALER MAY REFUSE TO FIX THE PROBLEM IF YOU SCREW UP. I have made 1/2 dozen mods like this

and never had any problems.

Good luck, and don't hesitate to send mail to someone else if you
have problems.

I have a PCPI AppliCard which does indeed run at 6mhz (it's great!). They
manage it by giving the card 64K of its own memory. It also makes clever
use of the Apple memory -- it stores CPM there. That way, it never needs
to go back to the system disk once it has booted.

From: Doug Gwyn (VLD/VMB) <gwyn@BRL-VLD.ARPA>

When I trundled by my local Apple dealer to look at the new color
monitor, he said that the price would be about $900 total, or
$600 for just the interface card if you supply your own monitor.
He wasn't planning to stock any because he doubted there would
be much market for them at that price.

I was thinking about replacing my Comrex RGB monitor (which is
limited to 8 colors, and one has to rearrange the R, G, B cables
to get a reasonable mapping of the expected colors), but at these
prices I dunno.

What software support is existing or planned for the Apple
Color Monitor 100? How about MousePaint, Graphics Magician, etc.?

I understand that Stanford University under a project called SUMEX created a
68000 version of C which can be used to create Macintosh applications. I am
very interested in the SUMEX C compiler and the associated include files, and
would appreciated any information on this project and the software.

Please reply via mail

thanks,

The price for the IIe color card is $299! no 600, the price for
the color monitor for it is (i think) $599.. The other 'rumor' that
I heard, is that this will be the monitor used for the COLOR MAC?

The software that ran on the IIe color card (This card takes the place of
the IIe extened memory card) Is REALLY SUPER, has all sorts of neat
color stuff, an overlay mode, (text overlayed with graphics) and
dip swicthes to change the color of normal 'white' text to white/green/amber

I have not seen these things, but talked to the customer in the store
who had bought the last one the store had, his comments where that the

poster about the thing 'didnt do it justice...'

I have just finished talking to the people at Stanford (SUMEX) about the
CC68 and associated include files. They have informed me that the software
is public domain and generally available on ARPA. However, I do not have
access to an ARPA site and was wondering if someone on USENET had already
received the software, and if so would mind sending a copy to ecsvax.

Thanks,
Kevin

Does anyone know anything about the Manx C compiler for Apples? Does it actually produce 6502 code, w/ hooks to the 'os' (dos 3.3 or prodos, according to the ads)? How close to their CP/M compiler is it? This, and any other info will be greatly appreciated. Thanx

     My followup on the Z-80 card is a follows:

          1) I was told that the on board ram on the apple
               was too slow for the z80 running at 6MHZ.

          2) If the 6MHZ z80 has it's own ram then this problem
               is solved!!

          3) If they only sell the 6MHZ cards with their own ram
               Then obviously it's not your problem.

          4) I have not had a chance to actually check the speed of
               the on board rams so They may run at 6MHZ ??

Some of the available explanations on the shift key mod can be a bit confusing, especially when it comes to pulling off key caps and soldering wires.

You should first get some good clip leads, with small ends, the kind that CE's use -- the leads should clip on to a wire with a small hook and have a push button on the top. You need one wire with leads on each end.

Refer to page 10 of the Apple Reference manual. Below the white box around 'Game I/O' in the chart, you will see a chip. You attach one clip lead to the lower right piece of the chip. The other end is attaced to the keyboard encoder in this way -- face the apple with the keboard closest to you, peek your head inside the box and look back at a row of exposed vertical pins about an inch or so long...you attach the wire to the 2nd pin from the far right. This works only for 'recent' apple keyboards, which you have if you bought you apple in the last few years.

You can use Ascii Express Professional, with an 80-col. board, emulate a VT52,
and use EMACS. I am using it here at ecsvax, and also on a Prime under
PRIMOS, and both EMACS versions work fine with my Apple II+.

I am using beta MacTerminal 0.5 with an 11/750 running Unix; the terminal
is connected to the VAX through a (theoretically transparent) local-area
network. I am still having the transfer problems that some others here have
been having: Macput compiles fine, after issuing the command
"macput -r melody.dl" the Mac puts up the "percent of transfer finished"
meter and trandfers about 20% of the file. Then the meter stops moving,
and after about 20 seconds the Mac tells me "GOT IO Error 1 Got BadResult -
getFork(resFork.". It appears that my connection is not dealing properly
with some aspect of the packet acknowledge aspect of xmodem (or something.)
One person has said that it might help to have the terminal directly wired
to the VAX, but I don't feel like carrying my Macintosh into the machine
room and plugging it into the back of an 11/780 just to play "melody"!!
    Let's get this bug fixed, guys! (please?)

I have just upgraded my computer system and I find that I
don't need two printers. This printer has been excellently
maintained and has performed flawlessly for me in the past.

The device is an Epson MX-80 with graphtrax (this enables
bit-mapped graphics). It has been modified for continuous
service by the addition of a cooling fan (cools the logic
board and he print head).

And, the best part about it is the price: $190.00.

HELP!

I am supposed to be teaching a C programming course at Front Range Community
College. The problem is the Apple computers to be used as terminals don't
have any software to emulate a terminal.

I DESPERATELY need a public domain terminal emulation program for Apple 2e,
and a suitable termcap (UNIX System V).

Anybody have a solution?

Thanks,

David Custer

I am looking for peripherals for an Apple II+/IIe system
(I will consider a complete system, depending).

Specifically, I am looking for a daisywheel printer, an Epson
LQ1500, and an Epson RX-80 or FX-80
Also very interested in graphics capabilities. Specifically,
graphics boards, graphics software (legal only), digitizers
and display boards, also digiting and graphics tablets.

I need to acquire a mouse, for the game I/O post, if such a
thing exists.

I am also interested in a voice synthesizer, and analog/
digital boards. A robotics controller card would be useful.

I will but these items inside of (14) fourteen days, new or
used. Either leave me e-mail if you have something available,
(please quote me a price) or give me a call,

Stanford SUMEX project.

1. INTRODUCTION

The gateway is a multibus system consisting of 3 cards:

"SUN" CPU board, 8 or 10 MHz, 256K RAM; in other words, the cheapest 68K board you can find; several companies make these, ours are from Forward Technology. You don't need DMA access or anything fancy.

INTERLAN NI3210 10mb ethernet card. This has onboard memory, so DMA is not needed on the processor. The Intel 82586 ethernet chip does automatic buffer chaining of packets.

SUMEX applebus card. This is described below; it contains about 6 chips and can be wirewrapped in an afternoon.

Other hardware required:

5 slot multibus backplane; Electronics Solution's work well.

Power supply; small switchers run cool.

Ethernet tranceiver (we use TCL), and cable.

Ribbon cable from CPU (50 cond) to two ribbon DB-25 connectors; these are the console and downline load serial lines.

Applebus tap and mini-DIN connectorized cable (from Apple).

2. SUMEX APPLEBUS CARD

2.1 PARTS

ARTEC (phone 415-592-2740) "multibus multipurpose interface board" ($165).
This board comes with the bus buffering and control logic all setup.
All you basically have to do is connect up your data IO lines and chip select.

ZYLOG Z8530 SCC; serial communications controller.

AMD 26LS32B; quad differential line receiver.

AMD 26LS30; dual differential tri-stateable driver.

DB-9, PC board mount, female.

7492; divide by six.

DIP pullup resistor pack (Beckman B98-1-R6.8K) 15 resistors.

XTAL, 22.1184 MHz; this is a "standard" frequency found in most stores.

Single package TTL oscillator, OR:

    74S04; clock "oscillator".

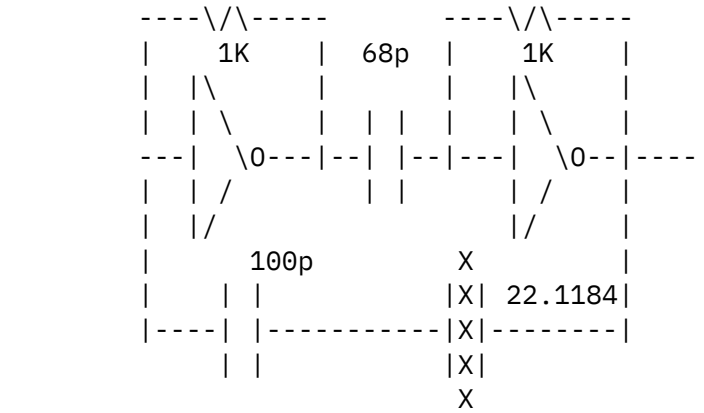
    2 1K resistors.

    100 pf capacitor.

    68 pf capacitor.

2.2 WIRING: OSCILLATOR

If you don't use a single package oscillator, this simple circuit acts as one: (you might run the output though a couple more spare inverters in the S04 to further "clean it up")



2.3 WIRING: 7492 (divide by six)

from	pin	to	pin
OSC 22.1184 MHz		B input	1
gnd		gnd	10
+5		Vcc	5
gnd		reset inputs	6,7
Qd output	8	SCC PCLK	20

The PCLK is derived as follows: 22.1184 MHz divided by 6 gives 3.67864 MHz; this is connected to the SCC PCLK, RTxCA, and RTxCB. In the digital phase lock loop mode, the SCC divides PCLK by 16 to get the FM0 sample rate: 3.67864 / 16 = 230400 bits per second.

2.4 WIRING: Z8530 SCC

from	pin	to	pin
gnd		gnd	31
+5		Vcc	9

```
7492 output   8         PCLK      20
PCLK      20        RTxCA,RTxCB   12,28
board DOUT    0 thru 7  board DIN 0 thru 7
board DOUT/IN 0         D0        40
board DOUT/IN 1         D1        1

August 28, 1984

Does anyone have information about SUMMAC? This compiler for the Macintosh
evidently was posted to the net a while ago but no one has been able to tell
me when.

I assume that SUMMAC is a c compiler that runs on a system other than a Mac
and transfers the executable code to the Mac. I use a VAX 11/780 that runs
UNIX System V.

Any and all help would be appreciated.

Scotty

I have decided to buy an Apple 2e for home use. Things I plan to use it for include --

#1 As a very smart terminal for work at home (I have a hardcopy terminal and a modem now, which I hope to put the Apple in-between so I can have a the equivalent of a video terminal with an attached printer.)

#2 As an educational aid for my kids (ages 4 and 6, now, but growing before my very eyes!). In particular I want to teach them programming, and I was much impressed with LOGO for that purpose when I had a chance to play with it for a week on my brother's Adam.

#3 As a games machine. Apple seems to have lots of good software in this line.

#4 As a software hacker's hobby machine. The 6502 is an interesting architecture, if a trifle old and grodey. Its limitations should make for an interesting challenge after 15 years of working on maxi-computers.

The above are not necessarily in priority order. My questions are --

Is #1 feasible? What special hardware do I need? An 80 column card and a hi-res monochrome monitor seem to be necessary, as do two RS232C serial interfaces, do I need anything else?

What version of LOGO is best for #2? There seem to be several available for the Apple. Anybody got any suggestions?

I expect #3 to take care of itself, but it looks like a color monitor will be required for maximum enjoyment. Can I get away with a 'cheap' color monitor (I can't stand the colored fringes around text when a standard color TV set is used for this purpose, so the really cheap alternatives are not acceptable.) Does anybody have a suggestion for the way to go on this? From the looks of the price lists I have seen, it appears that a cheap color monitor and a good monochrome monitor is less expensive as a combination than a single color monitor good enough to use as an 80 column terminal. Can anybody think of any pitfalls with this approach? Can I use the same interface card for both monitors, if I don't try to use them both at once?

As regards #4, What high level languages are available for the Apple? Pascal? C? Modula? Others? Anybody got any experience they want to share? It would seem that anything that would be really useful should generate native code. Are there such things available? How about software development tools. Screen editors? Symbolic debuggers? Linkers? Library software?

Also as regards #4, I have been impressed with OS9 for the 6809. Is there a 6809 add-in card for the Apple 2e? Similarly, the Apple format floppy discs seem awfully small to me, coming from a maxi-computer environment. What is available regarding add on discs. A floppy with about a megabyte on it for under 500 bucks would be nice. Has anybody heard of such a thing? Is there any way to get more on an Apple disc if I write my own software for it? Would full track blocking help? Is APLDOS or PRODOS capable of accepting user written drivers for add-on hardware?

And finally, What books or magazines, (or clubs?) would you suggest as references for the hardware and software internals. I don't like being talked down to, so the more nitty-gritty the better as far as I am concerned.

I will summarize any answers I get, so please reply by mail to --

There is an article in the current (Aug 84) BYTE,
which benchmarks various UN*X implementations on
various machines. Judging from their results,
LISA with Sys III+ is the slowest of the slow.
Even the IBM PC XT implementations were much faster.

I have just successfully compiled and downloaded Calendar, by
Mike Schuster at CALTECH. A very useful program!!

I have posted the tohex'ed source (calendar.dl) for the benefit of those who
who don't have access to a 4.2 machine running SUMacC. The source
can be found in net.sources.

To install the Desk Accessory..

fromhex < calendar.dl > calendar.rsrc

macput -r calendar

launch calendar, take a look at the Desk Accessory with the apple menu,
if you want it in that system disk, (I'm sure you will), pull
down INSTALL. Thats it.

Sorry if this is a duplicate posting for some of you. I dont think this got
very far the first time I posted it.

I have decided to buy an Apple 2e for home use. Things I plan to use
it for include --

#1 As a very smart terminal for work at home (I have a hardcopy
terminal and a modem now, which I hope to put the Apple in-between so
I can have a the equivalent of a video terminal with an attached printer.)

#2 As an educational aid for my kids (ages 4 and 6, now, but
growing before my very eyes!). In particular I want to teach them
programming, and I was much impressed with LOGO for that purpose when
I had a chance to play with it for a week on my brother's Adam.

#3 As a games machine. Apple seems to have lots of good software
in this line.

#4 As a software hacker's hobby machine. The 6502 is an
interesting architecture, if a trifle old and grodey. Its limitations
should make for an interesting challenge after 15 years of working on
maxi-computers.

The above are not necessarily in priority order. My questions are --

Is #1 feasible? What special hardware do I need? An 80 column card and a hi-res monochrome monitor seem to be necessary, as do two RS232C serial interfaces, do I need anything else?

What version of LOGO is best for #2? There seem to be several available for the Apple. Anybody got any suggestions?

I expect #3 to take care of itself, but it looks like a color monitor will be required for maximum enjoyment. Can I get away with a 'cheap' color monitor (I can't stand the colored fringes around text when a standard color TV set is used for this purpose, so the really cheap alternatives are not acceptable.) Does anybody have a suggestion for the way to go on this? From the looks of the price lists I have seen, it appears that a cheap color monitor and a good monochrome monitor is less expensive as a combination than a single color monitor good enough to use as an 80 column terminal. Can anybody think of any pitfalls with this approach? Can I use the same interface card for both monitors, if I don't try to use them both at once?

As regards #4, What high level languages are available for the Apple? Pascal? C? Modula? Others? Anybody got any experience they want to share? It would seem that anything that would be really useful should generate native code. Are there such things available? How about software development tools. Screen editors? Symbolic debuggers? Linkers? Library software?

Also as regards #4, I have been impressed with OS9 for the 6809. Is there a 6809 add-in card for the Apple 2e? Similarly, the Apple format floppy discs seem awfully small to me, coming from a maxi-computer environment. What is available regarding add on discs. A floppy with about a megabyte on it for under 500 bucks would be nice. Has anybody heard of such a thing? Is there any way to get more on an Apple disc if I write my own software for it? Would full track blocking help? Is APLDOS or PRODOS capable of accepting user written drivers for add-on hardware?

And finally, What books or magazines, (or clubs?) would you suggest as references for the hardware and software internals. I don't like being talked down to, so the more nitty-gritty the better as far as I am concerned.

I will summarize any answers I get, so please reply by mail to --

     Does anyone else out there in Netland use a Nestar PLAN series
Local Area Network? We at Galileo HS (not Proper) currently have three,
if you can call the old Cluster 1 (PLAN 1000) one of the series. I'd
like to find people who are also using the things and trade info on them.
Heaven knows that the only way to find anything out the way Nestar
supports us!

The most similar editor that I have found to Emacs under Apple-Dos
is Pie Writer. It uses control characters and escape-control
characters for commands. It is not in the same league as the CP/M
editors such as Mince or Perfect Writer, but the style is similar to
Emacs and roff.

I see no reason to discuss the Mac at all on this list. There's a fine
list created explicitly for the purpose of discussing the Macintosh. The
Mac stuff, being new&exciting, could easily crowd out fruitful discussions
of new IIc/IIe ideas and problems. I imagine there's still a thing or two
to say about the II+ also.

Let's restrict ourselves to Apple II* and peripherals here. Like many
others, I'm on both lists and don't want to see the same thing twice
from people who haven't seen it on one list or the other.

I've seen this bug also, and I believe it happens only when the stuff
to the left of the regular margin (the bullet or number and period) is
followed by a tab. I was recently doing a memo with some itemized
stuff that I put bullets in front of, followed by tabs. I then went
back and full-justified the items, and all the bullets disappeared.
The solution was to replace the tabs with spaces of different sizes.
It takes a little work to get the justification correct, but it works.
Definitely a kludgey solution, but it works.

Sorry to contradict everything said so far, but THE fastest disk access
for apple is using a routine called RWT. No that wasn't a typo. I do
not mean RWTS. I mean Read/Write a Track. No sectors. Sectors slow
the whole mess down.

There is a trade-off: convenience v. speed.

You have to copy these disks with a nibble copier, and its no good for
multiple file handling. It is great if you need reams of data (say for
a spelling correction program) very quickly.

I know of no such markewted utility, so you'd have to write your own
DOS. too bad.

I bought a Lisa mouse at a computer store going-out-of-business sale today
and I want to get the pin assignments and electrical specs on the mouse.
At the store we plugged it into a Mac and it worked just like the Mac mouse.
I suspect that the][E mouse is identical.

Could someone send me the info and if possible a pointer to an Apple
technical spec?

From: "Robert P. Cunningham" <cunningh@nosc.ARPA>

I've just acquired Softerm2 (version 1.06, and I'm in the process of
patching up to 1.07) which seems to work fine EXCEPT that ctrl-i tabs
sent from Unix machines are not expanded to tabs on the screen.

The problem seems to persist with whichever terminal emulation I use
(I've tried VT52, VT100 and TVI925), so I suspect it's an artifact of
my configuration or else something I'm doing wrong. The configuration
I'm having problems with is: Apple II+ with Microsoft 16k card, Wesper
80-column card, and Apple Super Serial Card with Hayes Smartmodem 1200.

I'd appreciate hearing from anyone with an idea of what might be
wrong.

Bob Cunningham (cunningh@nosc.ARPA or bob@islenet.UUCP)

p.s. Softronics Inc. will introduce Softerm2 for the IBM PC in July,
at which time they will switch their online response system to a
regular BBS and the Apple SOFTERM.UPDATE file transfer setup for updates
will no longer work. See the latest SOFTERM.NEWS at Softronics for
more info.

This discussion doesn't seem to relate to Apples, but this is where it
started, so...

I can't fathom the Halt-and-branch instruction, maybe it should read
Branch-and-halt?

The MODCOMP II's instruction set includes a series of 26xx (hex)
opcodes. 26FF is unimplemented but not trapped out. It stores 26FF
into the location following the current PC and then executes it.
Discovered accidentally, ended up being used by at least one US Air
Force installation to clear >>core<< memory.

Cheers,
Dick Binder   (The Stainless Steel Rat)

Subject: Re: Softerm2 tabbing problem help?

I think the problem with tabbing is most likely caused by your 80-column card. As far as I know, 80-column cards (the ones I've used) do not respond to the Tab ^I character for some reason. A program like Ascii Express has an option to have the tabs expanded in software, before they get to the 80-column card. I've never had any experience with Softerm myself, but you might try to find such an option.

This bug was mentioned in a posting on Compuserve. The poster of that note said he called Apple Technical Support about it, and that they verified the bug (much to their own surprise!). So I assume that they are aware of the problem.

I have seen no word yet as to whether or when this will be fixed.

Does anyone know how MacPaint documents are stored? Is the bitmap encrypted in any way? How does MacPaint know where to place the image on the 8x10" sheet? Are these questions answered in Inside MacIntosh? Please reply via mail.

> If one writes to an address between $D000 and $FFFF, and the card has not
> been selected (and has not been write protected), the write is still done
> on the language card. Of course, to read the card one has to select it.

This is the basis for an easy way to copy the F8 ROM into RAM (I'll just do one byte):

```
    LDA  $C081    ;Enable ROM read
    LDA  $C081    ; and RAM write (must do it twice)
    LDA  $FFFF    ;this fetches from ROM
    STA  $FFFF    ;this stores in RAM
```

Voila! Write-only memory!

An even easier way on the //e is to call the routine COPYROM at $CF78.
Notice that there is no language card on a //e. The upper 16K is simply called "bank-switched memory," a curious term since ALL the memory on a 128K //e is bank-switched.

I disagree with the net.micro.mac idea. I just feel that
creating sub-groups of the same company is a waste of resources.
Let each computer manufacturer have a sub-group. Now that the
builder field is in the process of being weeded out, this should
keep the number of groups down.

Do it like this:

Net.micro
Net.micro.ibm
Net.micro.com
Net.micro.ata
Net.micro.ti
Net.micro.app
Net.micro.whoever
Etc. Etc.

The only wading through articles you will need is at least
in the same ballpark. Don't create separate little niches
for every piece of equipment that falls off the truck. Keep
the same manufacturers together in one place.

     I would like to present the counter argument to the "SOFTERM 2"
"button debate". I personally like the three extra buttons, because now
I never again have to worry about a ctrl-L flipping the Apple into upper-case,
it is passed on through to vi the way it should. Yet I still have all the
local functionality, I just use the extra buttons to access it. Since I use
my Apple very heavily as a terminal, I am willing to give up the slot for
the ease of use.

I am soliciting evaluations and comments about
two versions of FORTH that I have seen adds for
in BYTE, Creative Computing, and Softalk; namely,
GraForth and TransForth IIB. Both versions run
on Apple II+. Anybody in netland used these products?
Advantages? Disadvantages? I would like to read
your comments.

Thanks in advance,

[<+>]

I'd like to second Doug Hall's very positive review of "Softerm 2". I have been using "Softerm" (earlier version - no longer available) for about a year, now, and there is no other terminal software for the Apple that's even in the same league. I can confirm that it performs flawlessly at 9600 baud, and that it does exact terminal emulations - no problems at all with 'vi'.

It also supports a very wide variety of hardware; most serial cards, most modems, most printers and printer interfaces, most 80-column cards.

The only desirable features lacking on my older version of "Softerm" is the ability to upload and download CP/M and Pascal files, and support for XMODEM protocol. These lacks resulted in our buying "Softerm 2" when it appeared.

So why, do you ask, am I not using the newer version? Because "Softerm 2" has one flaw - that card that adds the extra buttons to your keyboard. The Apple I use doesn't have a slot to spare for another card, especially for a card used by only one program. If that won't be a problem for you, then I recommend "Softerm 2" unreservedly, but if your Apple is as crowded as ours is, or if you're running a IIc (no slots), better find another program.

I frankly think the company made a bad decision when they added this card to the package, and I'm hoping the arrival of the IIc on the market will cause them to create a "Softerm 3" that doesn't require it. I also do not understand why the (long, detailed, full-page) ads for "Softerm 2" fail to make any mention of this 'feature'. Perhaps they realized it was not a selling-point, but rather a copy-protection scheme?

But I dilute my praise. To repeat: as long as you're not slot-shy, and can afford the $200.00 price tag, I can't praise this program highly enough. You will not be disappointed.

     Must correct the previous article - the DOS 3.3 skew is two-descending, and this is the fastest possible sector arrangement, *if* you patch DOS 3.3 so that the software is fast enough to read every other sector. Without the patch, DOS 3.3 misses its first chance at each sector and doesn't catch it 'til a full spin later. That's why it's so slooow.

Help!
     I am having difficulty getting a new USR PAssword Modem to function properly at 1200 baud. I have an Apple //e with a Prometheus Versacard as the serial interface. At 300 baud everything works fine (even vi). At 1200 baud however, the data displayed on the screen and also sent to the host is sometimes garbled. Most often newlines are omitted and solid blocks are printed instead of the proper character. Many characters are lost as well. There is some sort of pattern or regularity to the way the data get mangled however. A string of about 240 A's in a file when printed using the cat command

appears most of the time as a string of about 100 A's and 90 1's.
The Versacard and the jumpers in the modem are set for
eleven bit data words (1 start, 8 data, 2 stop). I tried all
sorts of dip switch combinations but nothing worked.
USR was not much help either. I called them and the person who answered
did not have any idea as to what might be wrong. I called him via
modem and he said that everything was ok. I did not see
any errors at that time either! He was using a ten bit word (
1 start, 7 data, 1 parity, 1 stop) however.
The way I figure it, if everything works fine at
300 baud I must have the jumpers, switches etc. set properly.
USR claims that the modem is ok. Anybody have any ideas as
to what the problem might be?
     I also took my WE Dataphone 300/1200 home from work one day
and without changing anything but the modem I worked at 1200
baud without any problems.   Anybody else ever see this sort of thing?
Is there a solution or is there really something wrong with the modem?
              Any help would be appreciated,

--

Subject: Wanted..Mountain CPS Card..San Diego
Newsgroups: net.micro.apple
       Our current application at Loral Instrumentation uses an
      Apple][+ computer and software written which requires the use
      of a Mountain Computer CPS card. This card was chosen for its
      clock, which at one time was apparently some sort of a standard
      (or could we have been deceived). Whatever the answer to that

question, it seems that Mountain no longer makes this card, and every distributer contacted so far has no more of these in stock.
  If you have one and would like to sell it, or know of where one (or two) can be found, please let us know. Another option is to find a different card, probably a clock only, which has the same command structure as the Mountain clock.

Thanks in advance.
Please contact one of the following

Lines: 26

  Our current application at Loral Instrumentation uses an Apple][+ computer and software written which requires the use of a Mountain Computer CPS card. This card was chosen for its clock, which at one time was apparently some sort of a standard (or could we have been deceived). Whatever the answer to that question, it seems that Mountain no longer makes this card, and every distributer contacted so far has no more of these in stock.
  If you have one and would like to sell it, or know of where one (or two) can be found, please let us know. Another option is to find a different card, probably a clock only, which has the same command structure as the Mountain clock.

Thanks in advance.
Please contact one of the following
NICE people if you can help.....

Help! Does anyone know anything about
a graphics dump board for the Apple
called the Apple Dumpling?
Who manufactures it?
Also, I need info about its compatibility
with the Grappler+ board. Are they similar?
Any info, technical specs, etc. for the
dumpling would be most appreciated.

I understand that The Word from Microsoft will be copy protected in
such a way that the master disk will be required to run the program.

Microsoft's Multiplan is already set up this way, and several people I
know have tried to copy it with no success.

My feeling is that this makes the program worthless - Murphy's law
guarantees that when you *need* that disk to get out a critical
report, it will be found trashed. If you can't steal a program, it's
not worth buying.

Is there anyone who owns a Mac who is going to buy The Word in spite of
the above, and why?

If my "core" serves me correctly, this instruction would halt until a certain
event happened and then recommence processing. Thus it could be used as an
interrupt without branching.

/* . . . . . */

I'm interested in getting tiny C working on an Ohio Scientific
Challenger. For those unfamiliar with it, it's a 6502-based
machine. Therefore, anybody who's succeeded in porting to
an Apple, an Atari or a Pet could be very helpful. Specifically,
I need assembler listings, and any tips on interfacing to the
existing I/O system. Thanks.

(If this rehashes previous discussion, forgive me, but I am new
to the net. Besides, I'm mad.)

Flame on!

If you have read all of the sweetheart reviews of Prodos, beware!
Apple Computer may have a few gotcha's lurking there.

I just purchased Prodos for my aging Apple][. I bought the standard "User
package" which consists of one disk containing Prodos and an updated FID
program, and a, quote, user's manual, unquote.

The blasted user's manual is not really a guide to Prodos at all, but a
120 page manual for Apple's anemic copy program (the aforementioned FID).

The manual does not contain the commands to access Prodos from Applesoft in
immediate mode (i.e., when you're staring at your screen and want to rename
a file, what do you type in), or in deferred mode (what used to be ^D
commands in the ol' DOS 3.3), or the assembly language interface.

Now I expect a user's manual to an operating system to tell me how to use
the operating system, not just one utility program . (*&^%! 120 pages for a
copy program --- 10 pages would have been quite adequate.)

If you want to use the operating system, there are 2 other manuals to purchase:

1) The Prodos Technical Reference Manual ($40!!!!)
2) Basic Programming with Prodos   (price unknown)

This marketing approach by Apple seems to be just another instance of Apple Computer's disdain for knowledgable programmers and a ripoff of consumers.

Flame off!

A QUESTION:

Does anyone know if there are second sources for information about using, really using, Prodos? Apple certainly seems to have created a niche for a reasonably priced user's manual from somebody like Sam's.

(another question)
If I do buy the manual(s) from Apple, which one should I buy? Does the Technical Reference manual contain all the facts in the Basic Programming manual?

A COMMENT:

For a new operating system, Prodos is still laughably archaic. Filenames cannot begin with a digit so if you have a stock portfolio and want a file on 3M, you have to call it THREE_M or some such nonsense. Isn't it more work to put such restrictions in rather than leaving them out? I am afraid when I finally start using Prodos I will find more such inadequacies.

(Woz, how could you let them do this?)

You probably are suffering from crummy-lineitis!
Check the line with your local telco and find out if the
bandwidth is sufficient for 1200 Baud.   I have used
USR modems for some time and have found them ultra-reliable.
(I've got one running a BBS 24-hours a day!)

Check the line with the telco to see if it is sufficient for 1200
baud? PLEASE, don't bother. They will tell you that you can't
run any kind of data equipment reliably without buying what they
call a `data line', which costs a bunch extra. For service, you
can ask for a line balancing (I think the Password has a switch
for this, also); if you want service on a poor quality line, you
must demonstrate that VOICE quality is poor.

In case anyone was impressed by the latest ad for clickart showing
a very nice picture of "David", be aware that what you see is
NOT what you get. What you get is a picture with less than half
the resolution. With the Mac, you could get the picture in the ad on
a page, but not on the screen.

I'm getting a little fed up with the greed and shoddy craftsmanship I've
been seeing in Macproducts. (they say Habadex was ported from the Apple
in two months, and it shows, it shows). I understand that our modern
market mandates products released before they are ready, and while I don't
like it, it's there. But there's *NO* excuse to lie in your ads. If you're
ashamed of the garbage you're selling, don't sell it!

The ProDOS User's Kit is intended for the naive computer user. The
User's Disk provides the utilities necessary to format volumes, copy
them, rename files, and so forth.

The ProDOS Technical Reference Manual (part of the WorkBench series)
contains complete information for the machine-language programmer.

BASIC Programming with ProDOS explains how to do DOS 3.3-style file

access from Applesoft BASIC. To their credit, Apple has made old
DOS 3.3 BASIC programs continue to work under ProDOS, in spite of
significant structural differences between the two operating systems.

     - from the terminal of a happy ProDOS/ProFile programmer

The day after I posted this message I found that the mouse pc card has
labels on the back identifying the connector pins. The button, if I recall
correctly, just grounds one of the pins. I will post the details soon.

A friend of mine and I worked out a simple interface for a Hawley mechanical
mouse that became free when we replaced it with an optical mouse on one of
our Xerox Dandelion Lisp machines. It took about 5 chips to produce parallel
binary out. I designed the circuit and my friend built it and modified
his S100 Z80 system BIOS so that the mouse worked with Wordstar. I suspect
that the Apple mouse has the same coding scheme. I'll post the details when
I try it out.

Since people have been having mouse problems I'm wondering if you can replace
the LED and sensor easily. They seem to be plug-in components.

Does anyone know anything about this new super micro - the Dimension
68000? It is supposed to be a totally compatable computer. Produced
by microcraft, it is supposed to be 68k powered w. 1 meg. RAM, and the
needed coprocessors to run the IBM, Apple, and CP/M software.
(Includes the 68000, 8086, 6502, and Z80B proc.) Also has drives to
read the majority of 5.25" formats. Anyone ever seen one of these
dream machines. I have sent for info. (The unit can also run UNIX)
Will post anything I get.

This is what I now of the format of MacPaint:

MacPaint documents use only the data fork of a file, the resource
fork may be ignored. The data fork contains a 512 byte header and then
compressed data, representing a single bitmap of 576 pixels by 720 pixels.

HEADER:
4 bytes   Version number (default = 2)
38 * 8 bytes 304 bytes of patterns
204 bytes reserved for future use

Version number 0 means that the complete header will be ignored and
standard patterns will be used.

BITMAP   (following the header):

720 scanlines of compressed data.
This is 720 times the output of the Packbits routine.

[Into the ol' bit bucket]

I called a mail-order software shop called THE BOTTOM LINE (a good shop by the way) to check on the availability of Microsoft's WORD. They said that Microsoft had to do a major re-write of the system so it wouldn't be out until

November. I guess they wanted to avoid all the hassles they had with MULTIPLAN.

Can anyone out there confirm/deny this rumor? MACWRITE is okay for home letter writing but I need WORD for business.

Thanks in Advance,

Scotty

I had a Mountain Computer Real Time Clock, called "The Clock". It was
the first of all Real Time Clocks for the Apple, and it was the pseudo
"standard" of clocks for the Apple. But I sold it because it was a
large board that had a lot of chips that, when using the batteries
(mounted on the back of the board), the power would only last for FOUR
days. In reality, the battery power was only adequate for two days,
though, because after the first two days the power was so low the clock
was no longer even reasonabily accurate.

The latest clock now-a-days that has some nice features and supposedly
has become the "standard" has several different output modes, is the
ThunderWare Clock (also has a time output format that is the same as
"The Clock"). It also is supposed to be the biggest seller of clocks,
thus also kind of making it the new "standard".

You might want to look into that.

     Chuck

Yes MacWORD is to be delayed. I called Microspft and they confirmed
that there would be a delay. They did say that it would be released in
late August or early September. I do not know whether this is the
correct date or not.

MAJOR FLAME ***** MAJOR FLAME ***** MAJOR FLAME ***** MAJOR FLAME *****
****

Microsoft WORD is going to be COPY PROTECTED (see MacWorld July/August)
and the folks at MS have implemented the copy protect in the following
manner - one can make as many copies of the master disk, but one needs
to start the application with the master disk in the drive. Doesn't
this really defeat the need to make a back-up copy? If your master disk
dies, you STILL can't use WORD anymore.

<END OF FLAME> <EOF> <EOF> <EOF> <EOF> <EOF> <EOF> <EOF> <EOF><EOF>

By the way, I have tried out MacSLOTS which I just goe and it looks
really great. It costs $77.77 and is available from somewhere - it is
listed in the latest MacWorld and St.Mac issues. Backup copies can be
made as it is not copy protected.

There is also a limited C compiler coming out thi fall from Hippotamous
[sic] Software for $150 and a full professional C compiler coming out
sometime in November or December of this year. I am hoping, oh hoping,
for a real language compiler for the Mac.

Thanks all for now.....

Prune juice. The only thing the 6502-based Apple micros and the 68000-based micros have in common are the company that makes them, and some of the peripheral equipment available for them. I don't own a Mac or Lisa, but I am interested in them - but I personally have no interest whatsoever in the 6502-based Apples. I'm sure there are people out there who have 6502-based Apples who have no interest in Apple 32s. Perhaps what is needed is a per-manufacturer group and subgroups of those groups for all major distinct product families (i.e., net.micro.pc or net.micro.ibm would probably not need subgroups, as all the PCs form one family, but net.micro.apple would have two subgroups, one for the Apple II family (and possibly Apple III) and one for the Apple 32 family).

Yes, SUMacC uses a C cross compiler that runs on a VAX running 4.1 or 4.2
bsd and downloads to the Macintosh. It is still under development and is
undergoing debugging and enhancement. At the present time, it is only
easily available to Internet (e.g., Arpanet) sites. Before you ask, I think
it is probably too large to post to net.sources (>2 megabytes, a certain
amount of which is binary) and I also fear that posting to net.sources would
violate its copyright.

I am looking for a system for the Apple that will allow me to write manu based systems that will execute different programs based on the menu selection. I would like to have a submenu feature so I don't have to recall the original program.
If I get enough response I will summarize for the net.
Thank you.

How can you get the system let you write to the language card?

I want to use it for a program and all I can manage to do is to load
 int basic into it(not what I want!).

Another question comes to mind . . . How to you get the apple tool kit
 to assemble code into relocatable code?

P.S. I have a][e .

 thanks for all help.

I'm trying to find some information concerning the INFAX Disk Cartridge drives for the Apple II/IIe. If anyone has experence or knows of someone who does I'd like to hear positive or negative comments. These seem like a decent deal but I would like to hear from someone who has used them.

Anybody out there want to make recommendations on word processing software for the Apple II/c? I am looking at one with a second disk drive. My preference is emacs/troff (since I use it here) but I doubt that is feasible. I do NOT like wordstar. (period). Any suggestions welcome. Mail them directly to me and I will summarize, of course.

Has any one encountered a problem using a Microsoft IIe Softcard
with a super serial card? Several different cards of each type
have been tried in the Apple IIe we are using and in all cases
CP/M fails to boot if the serial card is set in printer mode.
The serial card drives the printer normally under Apple Dos 3.3
with or without the softcard in the IIe.

I, too am dismayed by the problems with uSoft BASIC for the Mac. It really
seems they have not done a careful job. That, coupled with the horrendous
bugs in Multiplan, which cause worksheets to be trashed, makes me wonder
how uSoft got the reputation they seem to enjoy. They certainly need to
clean up their act!

But I think it could be viewed from another angle: uSoft is one of the
few companies to have *anything* available for the Mac when the Mac was
announced. Yeah, they got in a hurry, but because of that, we can do some
work with the machine besides draw pictures and write memos! That counts
for something in my opinion. The only alternative to BASIC for writing

programs is Forth from Creative Solutions (??), and not being sure I want to learn Forth (or froth!), BASIC is my choice for now. I certainly am glad that it *is* available, even if it is a bit buggy.

I sure hope that uSoft will be open-handed with those of us who bought the early version of BASIC if and when they do generate an improved version. I think their attitude toward their customers in this regard is more important than the particular failings of the current version.

Here's an update on Quadlink's ability to cope with copy protected software and non-DOS operating systems.

There's no reason to think Quadlink would fail to run any 16 sector Apple operating system. In fact, it works fine with UCSD p-system Pascal 1.1 and with ADIOS, the enhanced OS from Microsoft that is needed for running muMath/muSimp without CP/M. (We don't have CP/M, so I have no idea what Quadlink does with Apple CP/M disks.) The muMath/muSimp disks are not copy protected, and the whole system works fine on Quadlink. (Would somebody please report on the IBM PC version of muMath, preferably with comparison to the Apple versions?)

The following copy protected software runs without problem on Quadlink:

  Krell's LOGO
  Graphing Equations (instructional games from CONDUIT)
  Interpreting Graphs (ditto)
  Screenwriter II (WP from Sierra On-Line)
  General Manager (DBMS "   "   "   )
  Super Disk Copy (utility from Sensible Software)
  Multi Disk Catalog (ditto)

The only other copy protected software we use on our Apple is
Softerm II, a communications/terminal emulator package from
Softronics. It DOES NOT WORK on Quadlink, but not because of the
copy protection. It has a keyboard enhancer card to add 3 "shift"
keys, and it bombs when it fails to find the card present. One
might hope to be able to use parts of the package that don't
depend on the extra keys, but no such luck.

Re: "have apple DOS 3.3 understand lowercase commands"

Yes, you can have some software or firmware placed as an input editor. Its job is to monitor everything sent from the keyboard and convert it to uppercase for you. But there may be times that you want to enter lowercase too, (like in PRINT or INPUT statments) so it will have to be a little more involved.

One piece of hardware that will do exactly that and a WHOLE LOT MORE is the Hollywood Hardware "Ultra Rom Board/Editor". In my opinion, if there is any time you work with Apple DOS, DavidDos, DiversaDos, or ProDos, and especially if you ever do anything in Applesoft there is no finer addition you can make to your Apple! It works with the II, II+, and IIe, with the IIe's 80 column card and I believe the Videx 80 column card also.

I can talk for hours on this fine product, and no, I do not work for Hollywood Hardware; it's just that good. It is a ROM board that plugs into any slot, 1 to 7.
It uses no RAM space (other than Page 3 but that's no problem, and if you do have some conflict it's only one function of the board [GPLE] that uses that space, so you can disconnect that if you want). So where does the board operate from? It uses the $C800 - $CFFF area. It uses bank switching to fold in more than 2K of programs into the allocated 2K area. In fact the card can have up to 32K on it, all running out of that 2K area. All of the bank switching is invisible to the user. It will not conflict with other cards using that same area either. I have plenty of cards that share that same area and I haven't found a problem yet.

What are the features of the board? :
Improved GPLE (Global Program Line Editor)
Which gives you all kinds of editing powers. It is really like a word processor for Applesoft BASIC. Since it is a global editor it will also
"find" or "find-and-replace" (with prompting or not) if you want. Additionally, it gives you all kinds of macros on your keyboard. All

you have to do is press ESC and another key to do all kinds of things. Things like cataloging drive 1 or 2, or easy loading, running, locking, unlocking, or deleting a file in the catalog. You do not have to type the file name either, since the filename is automatically picked up off the screen for you. There are real nice features that allow single lines scrolls too, so that way, you can step through a catalog or a Basic program. And ^C will allow you to stop a catalog just like you can do while listing a Basic program.

Then you can even make your own macros. There is almost no limit to their size (the limit is the RAM of the Apple). And macros can call macros, can call macros, etc. So things can really get involved.

Plus there are 26 "&" commands to do such things as

- getting a Print Using function, which allows variable masks, and the masks give ability to automatically round off numbers, and even float a "$" sign to the immediate left of numbers.
- getting a If-Then-Else ability for conditional better conditional programming. Plus they can also be nested.
- number conversions (Hex, decimal and binary)
- finding the last binary load parameters
- finding the ASCII values of any key
- searching memory (including external RAM cards) for
  - any string
  - any set of hexadecimal numbers
- restoring lost (via NEW or FP or INT) Basic programs
- finding the present Himem and Lomem
- turning on or off a display control characters ability
- easily flipping on the different HiRes screens without clearing them.

Then there's the optional "&" commands that give you

- Renumbering, has got to be the best you have ever seen! It will allow you to renum anything to anywhere and if it finds that there isn't enough line numbers available it will give you a choice of using its recommended increment or force your own. All of the line number changes can also be printed to a printer, as they're being done, so that you'll have a hardcopy of changes. And, if it finds any lines that are "hanging" (GOTOs or GOSUBs to non-existant lines) it will flag them so you can fix them later.
- Variable cross reference is also the best I have ever seen! It will show you (with the ability to get hard copy also) every variable you are using in program. Every real, interger and string; every real array, integer array and string array. And it will show you how you are using them; ie. a if a simple reference, a changing, an input or get statement, a read statment, or even if used in a defined function. All of the variables are listed in two forms, the short, first two significant characters (plus $ or # and (, as applicable) and the long way - as the entire name. It has the ability to do a fast list, where only the variable names are listed. And you can even just list the particulars of any one variable, like to find out if your even using it anywhere.
- The Hide function is really keen. It will allow you to hide multiple programs, one after the other, stacked away like pancakes. Each time you request a hide, some information will be given to you,

such as how big (in bytes) the program was that you just hid and how much remaining space you have.

The Merge function is also very inteligent. It will not allow you to "tromp" or "trash" a program on another that share the same line numbers. But it will give you the option to force those same programs together, anyway, by having the program about to be unhidden assume the lower line numbers.

There is an AutoNumber utility that is very inteligent. It will allow, of course, and starting line line number and increment. It defaults to start at line 10 and and increment of 10, but if you have a program already in memory it will then default to a starting line number after the last presently used (plus the increment). It will not allow you "tromp" on an existing line number either. That way you won't accidently wipe out a line.

They even have another new ROM that gives you FID type of copy ability (file coping with a wildcard, too) and it will give you prompting if you want. Then there is also on the same ROM a Catalog editor that allows you to easily rearrange a DOS catalog to your liking. You can even enter inverse or blanking characters into file names, you can make "empty files" so that you can have clever header information in your catalogs, etc.

Lots of really usful stuff, and with all of the stuff mentioned above only four of the eight ROM sockets are used. So more expansion is still there.

Hollywood Hardware is located at
6842 Valjean Ave.

I have noticed that CONDUIT, which is a non-profit distributor of
instructional software, says in their recent catalogues that much
of their Apple software will run on IBM PC's with QuadLink boards.

Has anyone had any experience with this combination?

As Series Editor in Mathematics for CONDUIT, I have (and use) all
of their materials in mathematics. All of the Apple II materials
run on Quadlink. The only ones I had some doubts about were the

copy protected ones (see 2nd ref.), and they worked fine.

yes there is a way to have DOS accept lower case commands, the program
is listed below, here is how it works. There are several unused placed in
DOS that can store small patches, $BCDF-BCFF is one of them. In this location
goes a routine that reads a character from the input buffer ($200) and
checks to see if this is a lower case letter, if it is it changes it
to upper case (in the a-reg only not the buffer) and then lets normal
DOS take it from there. The routine that calls this patch is located
at $A193 and the change there is shown below.

```
    BCDF: BD 00 02  LDA $200,X
          C9 E1     CMP #$E1
          90 06     BCC $BCEC
          C9 FB     CMP #$FB
          B0 02     BCS $BCEC
          29 DF     AND #$DF
    BCEC: 60        RTS
```

    second patch goes here

    change A196 from LDA $200,X to   A196: 20 DF BC   JSR $BCDF

  the other method involving some $F000 or so location only allows

lower case letters to be typed, NOT accepted as commands.

While on the subject of lower case did you know that the Franklin computer allows for more variable names than the Apple. The Franklin allows for lower case variable names so variable aa$ is different from variable AA$!!!
Anyone interested in this can reply to me. (I own an Apple][my dad owns a Franklin.)

I am really excited about the MACpaint program for the MAC and the possibilities of developing diagrams for manuals, transparencies, etcetera. I am not in a position to go add a MAC to my collection of machines but I could acquire minimal hardware and software to add to either an IBM PC or APPLE IIe if it was capable of handling work similar to what MACpaint can do.

The product that comes to mind first is MOUSEpaint for the Apple II. Does anyone have any experience with this? Is it as good as MACpaint, what are its limitations? How about printing the results of your work? I would need to use an Orange Micro Grappler talking to essentially an Epson MX80 with Graftrax(?) - Does that compromise the output? If so what printer/interface mechanism do I need?

I also have an interest in having similar capabilities on a PC. Does anyone know of a product that offers these capabilities on a PC????

Please mail me any thoughts you have on this subject. Thanks!

Is there an upgrade deal available for upgrading from Apple Dos 3.3 to
ProDos??

What has happened to the upgrade deal on Apple Pascal??

Reply by mail and I will summarize to net.

Thanks.

The successor to the Apple Monitor Peeled is a very valueable book for
][+ owners called "What's Where in the Apple," available from an outfit
called Micro Ink in New Hampshire. Gives all monitor, DOS, and Basic
entry points and variables. Combined with Beneath Apple DOS and the
disassembled Applesoft which comes with the Merlin assembler, this tells

all the inside stuff I could imagine anybody wanting to know. I got
mine through a local computer store that specializes in hobbyist stuff,
and had to wait a couple of months for it -- don't know why it is so
hard to get. It think it was 20 or 30 bucks but it is worth it to the
serious Apple hacker.

There are a few I/O locations (address $C???) that control the language
cards (write-protect/enable, read RAM/ROM)

They are listed in the documentation you should have received with the
card.

If you can't find them, I can look them up.

I am trying to learn how to write drivers for this CP/M(tm) card, which
runs in an Apple(tm) //e. I have some information--the OEM information
that one can get from PCPI--but I am looking for sample drivers that
other people have written; and in general I would be interested in
sharing notes with other users.

I will be developing a graphics driver that will work with
the Double Hi-Res mode that the Apple //e has.

     I have been using Aztec C under DOS 3.3 for several months now
and wonder if I should upgrade to their ProDOS version. If you have
experience with that version, please mail me directly. I will summarize
anything of general interest to the net.
     The points I am most curious about are:

1. Is the shell a seperate operating system, or a system file which
   runs under the ProDOS MLI?
2. Is the compiler itself still the slow, recursive descent, interpreted
   one supplied for DOS 3.3?

                  Thanks

There is a bug in MacWrite as follows:
     If the indent margin is set to the left of the regular left margin
(e.g. hanging indent) and full-justification is on, a line consisting of
one or two characters (such as a bullet or a number+period) followed by a
tab (to the regular margin) followed by enough text to wrap to a new line,
will not always print correctly--the character(s) before the tab do not print.
I don't know what determines whether or not the bug appears; does anyone
else?

In most cases the text WILL appear correctly on the screen, so beware!

     Two not-entirely-satisfactory fixes:
1.   (This line may not print properly :-) Turn off full justification.
2.   If justification is needed/wanted, insert a ruler line after the
problem line. This effectively turns of justification for the one line.
Then insert enough blanks on the line to make it appear to be justified.
     I know, that's gross, does anyone have a better fix?
     Does anyone know if there is an official place to send bug reports
for Mac?

I have discovered a possible bug in MacWrite Version 2.2 which is
the recent update of MacWrite. When I am in the full justification
mode and employ bold underscoring, the text appears fine on the screen
but when I go to print it out under HIGH quality printing, the underscoring
gets messed up across word boundaries. The underscoring does not
connect across word boundaries like it does on the screen. When I switch
to STANDARD print quality, the problem disappears. Any comments?

[Take that, you filthy line eater!]

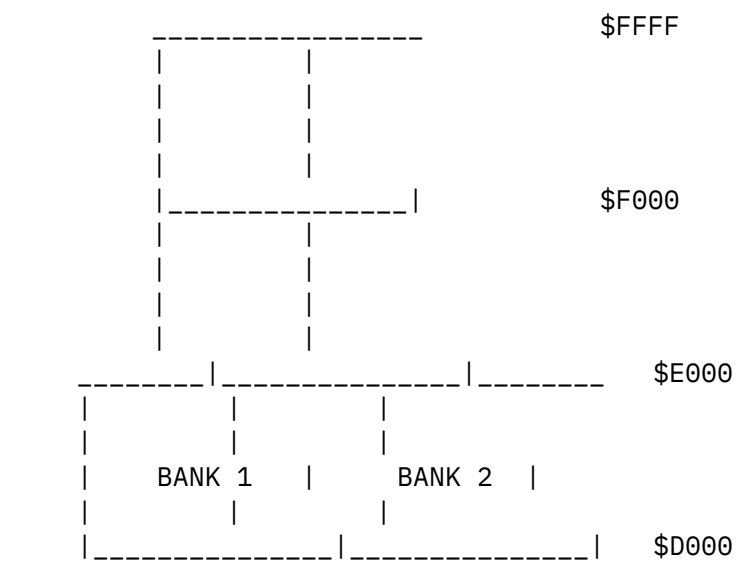
This is a bit long, but I thought it might be of general interest...

>How can you get the system let you write to the language card?
>
>I want to use it for a program and all I can manage to do is to load
> int basic into it(not what I want!).

Hopefully, the following will answer your questions:

                  Memory Organization

The Ramcard has 16K of memory, but has an address space allowed for it (forgetting for the momment $C080-$C08F) of $D000-$FFFF, or 12K. To "fit" the entire ram address space into this area, two 4K segments of memory share the space from $D000-$DFFF. When you select either bank one or bank two, you automatically select one of the two 4K segments plus the other 8K from $E000-$FFFF. The figure below illustrates this.



Ram Selection/Deselection

ADDRESS	Action
$C080	Read-Deselect Ram(Enable Rom). Write protect Ram
$C081	Read-Deselect Ram. Two sucessive Reads write enables Ram.
$C082	Read-Deselect Ram(Enable Rom). Write protect Ram
$C083	Read-Select Ram. Two sucessive Reads write enables Ram.
$C084	(Decodes same as $C080).
$C085	(Decodes same as $C081)
$C086	(Decodes same as $C082).
$C087	(Decodes same as $C083)

```
          $C088-$C08F     Same action as (ADDRESS-8),
                    except selects/deselects
                    Bank 1 of Ram.

Example:

;
;  RAMSET
;       Sets up ram card for usage.  Note that it doesn't
;    copy Basic Rom (excepting enough Rom for Hires graphics
;       routines).
;
RAMSET  LDA $C081
     LDA $C081              Enable Ramcard for writing

;
; Next a macro to move from,to,length
; This copies the Rom from $F300-$FFFF to ram
;
     MOV $F300,$F300,$D00

     LDA $C083
     LDA $C083     Finally fully enable second Bank of Ram
;                  (Read enable as well as write enable).

--------------------

Source:  What's Where in the Apple by W.F. Luebbert (Micro Ink)

    Notice than you should use reads, rather than writes, as the latter
will give unpredictable results (a write will select a memory location
twice, but in rapid sucession, so that the ramcard will notice two
address selections only part of the time).

    Hope this helps some.

                    Carrick Talmadge

It was brought to my attention that there will be a Mac terminal
emulator available in less than two weeks through the following
Co. As I was told there is 'no need' to any language processor
to run this program (e.g. like MacWrite). The package includes
some other usefull utility programs (applications in Mac's terms)
which makes life much easier in transfereing/recieving big files
considereing the storage limitation of the Mac.
The price as I was told would be less than 50 dollars.

For more Info write to the following:

Apple DOS also uses a little bit of intelligence in accessing the sectors
on a disk. Using a sector interleaving scheme in software is what allows
both Apple and third party Dos to alter the sector interleaving pattern.

I admit that Apple's might not be the best but this is what it is.

physical sector	logical sector
0	0
1	7
2	14
3	6
4	13

etc.

Apple DOS is slow for several reasons, but SAVE, and BSAVE times can be improved by removing the VERIFY routine that is executed after each SAVE or BSAVE. Replace those JSRs with NOPs. This is one method that those third party DOSes use to improve their speed.

I tried to respond to this by mail, but it didn't work. I said earlier that Apple Pascal is *much* faster on disk accesses than Apple DOS, and that it is also faster than CP/M.

How much faster than CP/M? I don't have CP/M myself, so my information here is second hand. I do know that Pascal uses a "two-ascending" sector interleaving scheme, while CP/M uses "three-ascending". Two-ascending is guaranteed to be faster as long as you are not missing sectors and having to wait an extra full rotation. Pascal can do this because there is less intermediate processing going on during a block read.

I don't have a reference handy and I can't quote any performance statistics, but I recall reading that Pascal beats CP/M on disk access, which is what you would expect when reading half the sectors that go by instead of a third.

Apple DOS uses a "three-descending" interleaving scheme, which is equivalent to "thirteen-ascending" and means there is a LOT of waiting between sectors if you try to read them in ascending order. A common optimization scheme is to read the sectors in descending order to cut down on the wait time, but that still leaves you with the equivalent of a "three-ascending" scheme, the same as CP/M.

As everyone knows, there is no free lunch. In order to get faster disk access, you have to give up something. In Pascal, what you give up is chaining; files are always allocated in sequential blocks instead of being strung randomly around the disk. This means you can occasionally run out of room on a file because space on the disk is fragmented. In practice, I have found that the problem is not serious (file compaction is quick and easy and does not have to be done very often) and I gladly make the tradeoff.

There is a second benefit: because there are no chaining sectors, you get more space for actual data on each disk (274 out of 280 blocks to be exact, where a block is 512 bytes = 2 sectors, the smallest amount of data you can address on a Pascal disk). That leaves 2 blocks for a boot program and 4 blocks for the disk directory. The actual data storage per disk is 140,288 bytes out of 143,360.

[]
     I recently bought Softerm 2, a communication/terminal emulation package for the Apple][. After using it for a week I thought I would pass along a few comments.
     Softerm 2 emulates a whole truckload of terminals (only one at a time,

however :-)) and supports almost any imaginable Apple][configuration. All the popular 80 column cards are supported, as well as the popular serial cards, printer cards, clock cards, and modems. Transmission speeds to 9600 baud are supported. I have used the program at 300 and 1200 baud with my Apple //e and 80 column card with no problems. The program has excellent file transfer capabilities, and can transfer DOS, Pascal, or CP/M files using any of three protocols, including XMODEM protocol.

Softerm 2 includes a 3 key 'keyboard expander' which, when used in conjunction with certain keys on the Apple keyboard, allows access to the many features of the program. Since the keyboard enhancer is used for Softerm functions, the Apple keyboard is used transparently, i.e. all ctrl and shift combinations may be used without the bother of accidently invoking some program function.

The Softerm 2 software comes on 2 diskettes. They are not copy protected. However, the program will not work without the keyboard enhancer, so the software is of no use by itself.

I've used the program for about a week now. Without a doubt it is the best I've ever seen for the Apple. It is an extremely versatile program, and has a lot of useful utilities built in. It has solved all of my file transfer and terminal emulation problems. I highly recommend it.

Now for the kicker. Softerm 2 retails for almost 200 bucks. Not cheap. If you don't need specific terminal emulation capabilities you can save some bucks by buying Softerm 1. It's essentially the same as Softerm 2, minus the terminal emulation features. Both Softerm 1 and Softerm 2 are from Softronics. I don't work for them, I just like their program.

I would say it is more than a possible bug. how about a definite bug.
I have discovered something similar with trying to use labelled
paragraphs by moving the left margin to the right of the indent marker.
(This is the effect achieved by .LP in the -ms macros.) Everything
is fine until I turn on full justification. Then the characters
to the left of the left margin don't print. (I have not tried different
print qualities.) One time they also disappeared on the screen. When
I moved to that point and typed an additional character, all the characters
appeared momentarily and then disappeared. The justification step seemed
to blank over them. When I go back to left justification, everything
reappears correctly. Coupling this with the observations from the above
article, it appears that there are serious bugs in full justification mode
in MacWrite.

Is there anyone out there who has up and running MacTEP (Terminal Emulator
Program) that was in A+ Magazine a couple of months back? Could you tell
me what the specs are? E.g. does it emulate a dumb terminal, what kind of
modem it will work with, what cables to use, etr cetera. I would like to
be able to do some UNIX hacking from my apartment (actually only reading
net.* - not supposed to do this during working hrs). Please respond via
mail or post in the net. Thanks in advance, y'all (No I am not from the
South.)

The following tidbit appeared in the March/April 1980 Apple Orchard.
(Mind you it doesn`t quite apply now)

THE APPLE RUMOR MILL
COURTESY OF PAUL KNEVELS

FROM The Michigam Apple-Gram

It has been rumored that APPLE is working on an APPLE III computer to be released shortly. At present the only advance information available is that a new microprocessor will be incorporated into the unit - the 6503.

Our research staff has been able to uncover a list of new opcodes that distinguish the 6503 as a breakthrough in computer technology.

The listis presented here for you information (and enjoyment).

After hearing the recent plaintive requests on net.micro.apple for a gateway
between the Usenet and the Arpanet mailing list named info-mac@sumex, I
contacted the Edward Pattermann, moderator of that group, and asked him if
he'd be willing to have one set up. Info-mac is already a fairly high
volume newsgroup and so consequently he had some well-founded objections to
setting up a two way connection between a net.* group and the list.
However, he did not have objections to setting up a read-only-like
connection such as what one gets with a fa.* group. This doesn't seem like
such a big restriction to me since there already is lots of mac-related
discussion in net.micro.apple. Usenet can continue to use net.micro.apple

for its discussions but can also refer to fa.info-mac for the information it provides.

Consequently, we have established a gateway from info-mac@sumex into fa.info-mac at uw-beaver.

I vote for a MAC group. I have no interest in II's and IIe's etc., but
am very interested in MAC.

These lists of strange op codes resurface from time to time; how about a
bit of trivia for you older hackers: the 1401 had a "Halt and Branch"
instruction - and it was actually USEFUL. Anybody want to try to explain
this one?

The II+ --> //e conversion card is a Steve Wozniak project. I read a
Woz interview (a Wozinterview?) within the last month or so in which
he mentioned some of the problems involved and he seemed to be rather
discouraged. It was not clear whether he had given up on the idea, but
I think it is safe to say that the conversion card will not be appearing
soon.

I don't remember which magazine it was, but I can look it up if anyone
is interested.

One other thing regarding reading and writing language cards. If one
writes to an address between $D000 and $FFFF, and the card has not been
selected (and has not been write protected), the write is still done on
the language card. Of course, to read the card one has to select it.

This is out of the Language Card Reference Manual that came with my card
(I bought it in 1981).

What is the most emacs-like editor for the //e?

I realize that the mass market doesn't like the
profusion of single-character commands, and the use
of control, meta, and control-meta characters.
However, it would certainly be feasible (I think)
to use open-apple for a meta-key. In that case,
has anyone put together a real emacs for the //e.
If not, how close can I get?

Thanks.

The legal and moral questions about Franklin computers aside I would
like to say that the Franklin computer has some features that EVERY
Apple owner should have. (I have a][+ my dad has a Franklin.)

I am talking about Franklin's version of FID (called FUD). Anyone that uses
FID has to know how frustrating it is, can't remember the numbers for the
functions (1 copy, 2 catalog, etc). FUD uses letters c for copy, s for show
files, etc. FID has a bad habit of asking for slot and drive numbers every
time you go from copy to catalog, FUD has defaults for slot and drive for
all of the options, there is no reset slot and drive feature on FUD, and there
is no space on disk feature, it is given after every catalog. FID puts you
back to the main menu after each function, FUD asks you if there is another
file you would like to perform that function on before returning you to the
main menu, this even holds true for I/O errors when VERIFYing an entire disk.
FUD has the Master Create program as a function, I know that this is outdated
but wait, with FUD's master create you can specify the file type to be executed
at boot time, Basic, Binary, or Exec!!

Hope I have convinced some of you that FUD is a must have, only one (and that's
it!) complaint, copying a locked file from disk 'A' to disk 'B' will result
in the file on disk 'B' being unlocked.

I have an Apple][which I am using with a Z80
card to run CP/M. I need to be able to upload and
download files with another CP/M system. Both systems
are using USR modems at 1200 baud, and the other system
is running a version of MODEM. So far, the only

communication program we've been able to get working
with the Apple and the Super Serial Card is DOS 3.3-based,
and even with CP/M conversion programs we can only
transfer ASCII CP/M files. This makes it difficult to
download objects for MODEM from an RCP/M, so I'm looking
for someone with the same configuration (Apple and Super
Serial Card) to get a disk from. Please respond by mail,
and I'll work out the logistics of getting the disk to you.
        Thanks in advance,

First of all I would like to thank all of you who responded to my plea for help with my Password modem. Using these responses I was able to solve my problem. Since many of you asked me to let you know how things got resolved I am posting this reply here instead of mailing each of you a separate response.

My main problem was reading the documentation for the Versacard first and believing what they claimed. According to Prometheus, a data format of 8 data, 1 start and 2 stop bits is the most common and therefore this is the default on the Versacard. Although the data format on the Versacard is software selectable, the documentation for it does not tell you how to do this. For this reason, I set up my Password for an 11 bit word (this is easy to do and is well documented in the Password documentation). As you know everything was OK at 300 baud but it did not work properly at 1200. To solve the problem I reset my Password to use a 10 bit word since many of you told me that an eleven bit word was not correct for 1200 baud. I also had to find a way to program the Versacard to recognize this format properly. I was able to do this by using the Softerm communications program since this package has a driver specifically for the versacard. By selcting the appropriate options I was able to get the Versacard to use the 10 bit format! I had to make on other change and that was to get Softerm to use the DTR signals instead of Xon/XOFF to control timing. After all that, everything works beatifully!!

Thanks again to all those
who helped out by responding.

HELP!!!

I need a copy of WordStar version 3.01P source code for my Apple II+.

Due to the careless (and unforeseen) use of a brass lamp, both of my WordStar source diskettes have been de-magnatised.

If anyone has a source disk that I could copy back onto my original disks, I would be forever greatful. I would like to avoid sending them back to the company if possible.

Please response by mail. Thanks a million!!!!

Regarding CP/M cards and apple II-type machines, one thing I did not
see mentioned was that you might have power supply
problems. Although most TTL stuff as used in Apple][-style machines
will work with 4.8 volts or so, the z-80 seem to be much more
finickey and require an honest-to-goodness 5 volts. If you supply
is delivering under 5 volts, it is possible that almost everything
under the sun will work except your z-80 card (or it may work
erratically).
  If you want to try fixing things yourself, there should be a little
hole in the bottom of the power supply with has a trim-screw underneath
it. Adjust this while using a voltmeter to check out what you
are doing.
  (Note also that this must be done while the suppy is connected
to the system -- the supply will fail to operate in a "no-load"
condition.)

I'm posting this for my sister. She is vacationing in the states
right now from Brazil, where she lives. Her sons' school has
acquired an Apple II and a IIe. Among other things, she's
looking for good programs teaching basic skills like reading
and arithmetic (or anything, really, as long as it is well
written and useful). Her sons' are 8 and 4 years, so we're
talking elementary school kind of stuff. The programs will
be used by other children at school too, though.

She's already acquired Logo, thanks.

As a former teacher, my sister has some notions about what a
"good" program will do. For instance, she was not impressed
with a reading program that displayed everything in upper case,
since visually the two cases are very different. She prefers
positive to negative reinforcement.

These are just some basic guidelines, but all recommendations
will be passed along. Please reply by mail.

Isn't there a expansion card for the PC that will let it emulate an Apple II,
or read its disks or something like that? I thought I heard about such a
card, and it would be quite useful for converting some Applesoft programs
to Microsoft for a PC. Any info appreciated.

Thanks,

Discussions on whether we should have a Lisa or Mac news group have been going
on for ages, and with the increased amout of trafic that is being generated by
these machines (mainly the Mac), it's about time something was done. Although
they are both Apple machines, we could at least have a sub-group of
net.micro.apple, or more important a net.lisa (for Lisa technology, not the
machine).

I'm converting a program from Apple pascal 1.1 to
the 128 K flavour of pascal 1.2 on an Apple //e.
The program uses attached drivers and interrupts. Apple
Netherland supplied a version 1.2 ATTACH but with the
1.1 manual (Apple technical note #11). The only person at
Apple to help me out left for a 3 weeks holiday yesterday.
Can somebody in netland tell me how to use interrupts in
an 128 K 1.2 driver. It must be quite different from version
1.1 due to the bank switching.

Thanks,
Gijs Mos @ Biolab Free University

Are there such things as games for the Apple IIe that
are basically static? I have a friend who is a teacher for
the handicapped and wants games that will wait for a student

to move. These students are severely handicapped and can't move accurately or fast enough to use animated games. Thank you.

Would anyone having any information on the Olivetti/Docutel
Ink Jet Printer please let me know if it can be used
for Graphics, Letter Quality, compressed print, ...
Also, does it have many serviceable parts?
Does it use standard paper?
Are ink ampules costly, and in what colours?
I am thinking of purchasing this printer, but
I would like some more information first.
Also, is all I need a parallel card to hook it
up to my APPLE II+, and will the CPS card
from Mountain Hardware suffice?
Thanks a lot for your help,
I will post responses to the net,
GARY

The other day I found a dealer which has Sony Microdisks on sale. They were

in packages of 5 ea, for $36.90 per pkg. I bought a package and got it home before I realized that this translates to ~ $74 for 10 disks! And I was refusing to buy Memorex disks at $70/10!

So far, the pricing for disks appears to be: Apple disks (when you can find them) are $48; HP disks are $58-60; Memorex are $70; and Sony at $74.
(Evidently the price is high because the supply is low (I HOPE!))
I have seen and heard various tidbits about HP disks not working very well, and about Memorex disks being D.O.A.--apparently, shutters on some disks are different preventing insertion of the disk into the Mac drive, and some disks won't format properly. One dealer I visit absolutely recommends AGAINST using HP disks in the Mac, but 10 of 10 HP disks that I tried have worked no problem.

Soooooooo.... what are the experiences of other Mac Users on the net? Anyone have any horror stories? Any Recommendations?

This is intended for Eddie Kessler (ARPA: eddie%su-psych@su-score).
Sorry about posting to the net, but I can't mail to ARPA.

My terminal emulator is in Modula-2 (Volition Systems) which runs under Pascal 1.1. Of course the interrupt handler and the time-critical code is in assembly language. I don't have the source on line, because the file transfer routines are not implemented yet. I can certainly sympathize with your remarks about lack of time!

I do not use an ATTACH driver to handle the interrupts because the terminal emulator is the only program I have which needs to use

interrupts or the serial port, and it seems to be easier, probably faster, and certainly more space-efficient to put the interrupt logic into the program itself. This also means I can write an interrupt handler that does not need to reference the I/O locations on page 1, so interrupts can be left on all the time. Modula-2 automatically enables interrupts except when doing disk I/O. I believe Pascal 1.1 has a few problems with interrupts.

If you want to disable interrupts when page 2 is swapped in, you might use the ROM listings as a starting point. To clear the screen, for example, the scheme is

1. Clear page 1, leaving interrupts enabled.
2. Disable interrupts and swap in page 2.
3. Clear page 2.
4. Swap in page 1 and enable interrupts.

Step 3 takes enough time to cause problems at 1200 baud. For a possible fix, look at the routine BASCALC (the one in the 80-column firmware, not the routine by the same name in the F8 ROM). This routine is called each time you move to a new row to compute the base address. BASCALC checks what language is running (BASIC or Pascal) and if BASIC is running it calls a routine in the F8 ROM which "sniffs" IRQ. This is not done under Pascal because the F8 ROM is not active. Since you almost have to duplicate the ROM code in your terminal emulator anyway in order to make changes, this one probably fits right in. The same modified BASCALC should also fix your scrolling problems.

I have not run into any assembler or linker problems with Pascal, but I did find one that seems to show up only under Modula-2. There are some updates in the wind, both hardware and software:

1. Look for a //c-compatible ROM to plug into the //e Real Soon Now. If you don't run canned software you may never need it, but some new programs being developed for the //c may not run on a //e with the old ROM.

2. Apple Pascal 1.2 is apparently being shipped now after some delays, though I have not received mine yet. I heard that an unacceptable number of bugs were found in 1.2 when it first came out. This version is supposed to support 128K and double density graphics on a //e, as well as fix some problems in 1.1.

3. Volition Systems has announced a new Modula-2 to work under Pascal 1.2, but the release apparently has been delayed because of the problems with 1.2.

4. You will probably need a new ATTACH document for 1.2, but it may not be available yet. I called International Apple Core about two months ago and they knew nothing about it.

Hope this helps.

I would like to get instructions for building an apple joystick, preferably for two joysticks. Can anyone out there help me?

Thanks in advance!

the Tacmaster

     Does anybody know how to open a file (in MS-<yuck>Basic)
to write to the resource fork instead of the data fork? Or what ROM
subroutine (Address and calling sequence please) do I have to call.

                         Thanks in Advance,
                         Teodoro Alonso

Penguin Software's Graphics Magician comes with instructions.
Penguin has commendably left their non-game software copyable
for the convenience of the rightful owner, under the condition
that the owner will not redistribute it. If you have the
right to the software then you have a registration card on
file at Penguin and they will undoubtedly be happy to supply
you with a replacement manual. Otherwise you are a thief and
should be discouraged in every way possible, so as not to ruin
things for Penguin's legitimate customers.

Lines: 145

The following material spontaneously evolved from a mudpuddle
(amazing, isn't it?)

The MacPaint Document Format
By Bill Atkinson

MacPaint documents are easy to read and write, and have become a standard interchange format for full-page bitmap images on Macintosh. Their internal format is described here to aid program developers in generating and reading MacPaint documents.

MacPaint documents use only the data fork of the file system; the resource fork is not used and may be ignored. The data fork contains a 512 byte header and then the compressed data representing a single bitmap of 576 pixels wide by 720 pixels tall. At 72 pixels per inch, this bitmap occupies the full 8 by 10 inch printable area of the Imagewriter printeg page.

HEADER:

The first 512 bytes of the document form a header with a 4 byte version number (default = 2), then 38*8 = 304 bytes of patterns, then 204 unused bytes reserved for future expansion. If the version number is zero, the rest of the header block is ignored and default patterns are used, so programs generating MacPaint documents can simply write out 512 bytes of zero as the document header. Most programs which read MacPaint documents can simply skip over the header when reading.

BITMAP:

Following the header are 720 compressed scanlines of data which form the 576 wide by 720 tall bitmap. Without compression, this bitmap would occupy 51840 bytes and chew up disk space pretty fast; typical MacPaint documents compress to about 10 Kbytes using the PackBits procedure in the Macintosh ROM to compress runs of equal bytes within each scanline. The bitmap part of a MacPaint document is simply 720 times the output of PackBits with 72 bytes input.

READING SAMPLE:

```
CONST srcBlocks = 2; { at least 2, bigger makes it faster }
      srcSize = 1024; { 512 * srcBlocks }
TYPE diskBlock = PACKED ARRAY[1..512] of QDByte;
VAR srcBuf: ARRAY[1..srcBlocks] of diskBlock;
    srcPtr,dstPtr: QDPtr;

{ skip the header }
ReadData(srcFile,@srcBuf,512);

{ prime srcBuf}
ReadData(srcFile,@srcBuf,srcSize);
```

```
{ unpack each scanline into dstBits, reading more source as needed }
srcPtr := @srcBuf;
dstPtr := dstBits.baseAddr;
FOR scanLine := 1 to 720 DO
  BEGIN
    UnPackBits(srcPtr,dstPtr,72);  { bumps both ptrs }
    { time to read next chunck of packed source? }
    IF ORD(srcPtr) > ORD(@srcBuf) + srcSize - 512 THEN
      BEGIN
        srcBuf[1] := srcBuf[srcBlocks];  { move up last block }
        ReadData(srcFile,@srcBuf[2],srcSize-512);
        srcPtr := Pointer(ORD(srcPtr) - srcSize + 512);
      END;
  END;
```

WRITING SAMPLE:

To write out a 576 by 720 bitmap which is contained in memory, the following fragment of code could be used:

```
TYPE diskBlock = PACKED ARRAY[1..512] OF QDByte;
VAR srcPtr,dstPtr: QDPtr;
    dstBuf: diskBlock;
    dstBytes: INTEGER;

{ write the header, all zeros }
FOR i := 1 TO 512 DO dstBuf[i] := 0;
WriteData(dstFile,@dstBuf,512);

{ Compress each scanline and write it }
srcPtr := srcBits.baseAddr;
FOR scanLine := 1 TO 720 DO
  BEGIN
    dstPtr := @ dstBuf;
    PackBits(srcPtr,dstPtr,72);  { bumps both ptrs }
    dstBytes := ORD(dstPtr) - ORD(@dstBuf);  { calc packed size }
    WriteData(dstFile,@dstBuf,dstBytes);  { write packed data }
  END;
```

This will probably only help you if you have Inside Macintosh; even then, the PackBits and UnpackBits calls to QuickDraw are currently not documented (the above code shows how to call them from Lisa Pascal, by referring to the IM chapter "Assembly Language" you could figure out how to call them from assembly code).

To read MacPaint documents from BASIC, you would probably either need to figure out what PackBits and UnpackBits do, or write an interface routine in assembly and poke it into memory.

Inside Macintosh is a two volume set (in two LARGE three ring binders) which describes all but 37 of the traps to the Macintosh ROM, which

includes the OS, the user interface toolkit, and QuickDraw.

Also available (and necessary for program development) is the
"Macintosh Software Supplement to the Lisa Pascal Workshop 2.0" which includes
2 disks of Macintosh example programs and utilities (including the
resource mover, alert/dialog editor, font editor, icon editor, etc.),
1 MacWorks disk to allow you to run most Macintosh software on the Lisa,
1 MacWorks disk with the LisaBug debugger, and 4 disks full of the actual
Lisa software you need to develop Macintosh applications (you still need to
get the Lisa Pascal Workshop 2.0; this is just a supplement) and source code
of several example programs and a desk accessory. When you purchase the
supplement you also get (someday?) the updates to Inside Macintosh and a
final copy (probably about when the Mac is obsolete). Beats me why the IM
update comes with the supplement rather than the IM itself. Oh well, you
need both anyhow.

Inside Macintosh and the Macintosh Software Supplement may be obtained (at
least they could when I got 'em) for $150 and $100, respectively, by sending
a company check (no P.O.s) to Apple's San Jose order processing facility:

Apple Computer, Inc.
467 Saratoga Avenue, Suite 621
San Jose, CA 95129.

They told me to expect to get it four to six weeks ARO; I got mine six
weeks to the day after I got the return receipt from the post office
(I was beginning to pull my hair out!)

The Lisa Pascal Workshop 2.0 (Apple part no. A6D0201) should be available
from your local Apple Lisa dealer.

Does anyone have a list of the error codes from Macterminal
-0.15x ? I've had problems running macget at 9600 baud with
frequent errors once the ruler reaches the 100% mark.

"Got IO Error -39 readin
 FillBuf"

Huh? Or while transfering files via macget, the mac will show

"Got IO Error -49.."

After which the file transfer continues like nothing happened.
Can anyone show me the light on these error codes and what
they are complaining about? Thanks in advance.

I've begun as a home business the publishing of a monthly newsletter for people who have an interest in home computers but know little or nothing about them. You are probably too sophisticated for this newsletter, but you have friends who would enjoy reading it.

The newsletter is called The HOME COMPUTER Newsletter. Without a lot of technical jargon and buzz words, it will bring the following:

- price information
- quality information
- new product announcements
- trends from the computer industry
- information for new users to help them feel comfortable with their new systems and to learn how to use the systems more effectively.
- my opinions and recommendations about home computer matters.
- answers to questions, etc.

The first issue, which is a pre-subscription issue (subscriptions begin in October), discusses the following topics:

- Welcome to the Newsletter
- What the Newsletter will contain
- The home computer market
- News flashes
- Protection from lightning
- What are home computers?
- Some good reading
- Price trends
- In the next issue (news flashes, what to do with a home computer, how to select a home computer, should you buy mail order or from a store, and should you buy a "complete package" or individual components.)

If you feel your friends would be interested in looking at the paper, please pass this information on. The yearly subscription is $7.00 in the USA and Canada. A sample issue can be obtained by sending 25 cents and a stamped self addressed envelope. The address is:

The HOME COMPUTER Newsletter
P.O. Box K126

E. Pepperell, MA 01437

Thanks!

In Albuquerque NM, there are no Apple Macintosh
disks at all. If you want 3.5-inch media, you have to
buy Sony. (I ordered the Software Supplement and got a
letter saying that even Apple has run out of disks, so
that Supplement shipments are running 3-4 weeks behind
schedule.)
The Sony disks cost $50 for a box of 10, and
are available only at MicroAge. The dealer tells me that
Microsoft just placed a $1M order for the disks from
Sony, so she got smart and ordered a few thousand disks
before supplies began to run short.

Please excuse me if you have already read this, but the first article didn't show up here.

I would like information for building an apple joystick (preferably for dual joysticks). I have gone through countless magazines in search of the elusive joystick instructions, to no avail. Does anybody out there know where I can find this information?

Thanks in advance!!

Mark Holden

I am an Apple II+ (64K) owner interested in purchasing a hard disk.
Can anyone in net.land suggest some choices?

Additional information/questions: (1) I have some frequently used
programs that are not Prodos compatible (e.g., ASCII Express, Pie
Writer, etc.) that I would like to put on the disk and use. Is there a
hard disk that will allow me to configure portions for DOS 3.3 and
Prodos? (2) Which hard disk offers the most bang for the buck?

Thanks in advance for the information.

Mike Warren

An apple][(+)(e) joystick is simply a 150K potentiometer with one
side at ground, the other at +5 and the wiper to the joystick wire
on the connector.

I spoke to one Apple dealer over the last weekend about the different
brands of diskettes. Apparently, the Apple diskettes are the same as
the Sony diskettes.

The diskettes manufactured by Memorex and Maxell are of inferior quality
(according to the dealer) They are priced at the same or higher leels
than the Sony diskettes. The reason for the difference in quality is as
follows:
     Look at the first 1/16" wide annulus on the diskette surface.
(e.g. a ring 1/16" wide in from the edge of the diskette) On the Apple
or Sony diskettes, this region is smooth. On the Memorex or Maxell
diskettes, this region is rough and kind of fuzzy.

Not a good thing to
stick in your disk drive. Apparently, the original release of Microsoft
Multiplan was released on on of the latter two diskette brands, which
had a lot of problems with disk readilibity due to poor manufacturing.
The have subsequently switched to Sony/Apple diskettes.

Anyhow that is all that I know. The Sony diskettes are about the same
price as Apple diskettes. The prices should go down eventually. And by
eventually, this is probably the same time scale as "eventually there
will be lots of Macintosh software."

Macintosh, Apple, Microsoft, and other stuff I have forgotten, are
trademarks of the usual people.....

There was an interesting article on a spatial database system for the
Mac called Filevision, posted to fa.info-mac by a person named "John".
"John" indicated that he would answer further questions about Filevision.
Unfortunately, the header information stripped off all indications of
what part of the continent "John" comes from (or even what continent)

Filevision sounds very like a project we are working on, and I would
like to know anything about it that is public, such as who makes it
and what it can do. If "John" or anyone else on the net knows anything
about it, I would much appreciate information.

I am trying to get a copy of fromhex in fromhex format. I am currently
using the MacForth version recently submitted to fa.info-mac, and it
would be rather nice to use it to bootstrap up fromhex as a genuine
standalone application.

I had bad luck w/2 USR modems and called them up. After many phone transfers
and finger pointing, they said that there was a refit for noisy lines. Sent
them both in and 1 week later they were returned and were much better about
line noise.

I have heard various rumors about a 6502 CMOS replacement chip that
has a 16 bit mode of operation, with a 16 bit instruction set different
from the 6502. When in 6502 mode it acts like a normal 6502. Does anyone
know about this chip and whether you can plug it into existing 6502
computers (apple II)? Software??

Please mail responses to me and I'll summarzize to the net.

Thanks in advance,

Dale Call

We're thinking about doing some development for the Mac for the government.
What's the best way to set up a
development system? Do we need a LISA (that's what Apple says)? How
about a Mac with FORTH? Is that really practical? What are the limitations?
Finnally, as a long time C programmer, is there a way to do development in
C? Thanx in advance, and remember all you Mac developers, this is government
work, we won't compete with you.

After dozens of requests reached me, I decided to post the sources to David Betz' XLISP interpreter. It is written entirely in C, commented uncommonly well, fairly portable, and has some rather neat features including primitives for object-oriented programming.

The program is in the public domain, Copyright by David Betz.

The Olivetti is a nice printer
but the manual is very vague on how
to do the hi-res graphics (it is very
hi-res). Infact the program that gives
the example on how to do it doesn't
even work! (well at least on the TRS-80)

After trying different things
we seemed to get somewhere but didn't
understand any of the codes and stuff.

If you want standard printing
with different sizes and features
they all work. It works great with
everything except the graphics. If
ANYONE understands how the graphics
working I would like to know. I will
share my knowledge of what have have
accomplished (we could print vertical
lines and few other things).

[adding lines is fun....I do it in papers a lot!]

I have been using the apple since it first came out (my first apple was 16k)
and every version is 95%(BIG 5%) compatible with the previous version.

I would just like to say that I am very disappointed with the][c and
 its compatiblity with the][e. I learned how to break games one summer
 just for the fun of it and now I am breaking all my games just to get them
 up and running on the][c. One game (the hardest game to copy I have ever
 seen(can't copy it)) come up real easy and another which is copied with
 a COPYA needs to be Flashcarded before it comes up. I have been told that
 the hard protection systems blow it but.......

Has anybody every had problems like this with the][c?

Also, anybody ever seen the inside of Ultima I? I managed to catalog
 the player master while trying to bring it up on a][c.

Send me mail... I LOVE mail.

          Josh Siegel

 {convex,ucbvax,gatech,csu-cs,anl-mcs,lanl-a}!unmvax!unm-cvax!josh

P.S. I don't copy things without paying for them. I do it just to back
 things up(and to cheat on them). Its just a point to note that everything is
 copyable except Flight Simulator][(can't copy it) and the copy programs
 used to copy programs.

Being plagued with a wife who has reached the end of her rope, I'm
posting this question to the net.

In the Hayden Software text adventure game "Crystal Caverns" she has
amassed 405 points and earned the rating of "guide". She has a map to
the maze but cannot find the maze or a power pack for the lamp, and
cannot deal with the iron panel.

Any help will be appreciated.

Cheers,
Dick Binder   (The Stainless Steel Rat)

[]

I have just had an opportunity to evaluate a self teaching program for the Mac offered by American Training International called MacCoach. The package consists of two disks and a 10 page manual. With these materials and a Mac, the student can learn the basics of operating a Mac in a matter of a couple of hours. The system uses grahics of actual desktop situations along with overlaying windows containing instructional text. The student is required to do something (usually click a "dog ear") to move on to the next window. Some of the text windows require the student to demonstrate that the concept has been mastered, by doing whatever it is that is being presented. Each of the 12 sections ends with a summary and a review of the material that has been presented. Sections include the following:

- How To use (MacCoach)
- Get Ready
- Your System
- Your Keyboard
- Use Icons
- Use Windows
- Save Your Work
- Manage Documents

    Manage Disks
    Print a Document
    Applications Software
    Conclude Your Work

The system also includes MacCoach Help. This is a collection of Scrapbook pages that can be moved from the MacCoach disk to any of the users disks. Then the user can use the Scrapbook at any time to review techniques. This is a good idea, if you can spare the disk space (20K.)

All things considered, it could be a useful package for the first-time user who doesn't have access to an experienced user. The same intro. type material could be conveyed by an experienced user in the same amount of time or less. The package costs $75 from ATI. This seems like a lot of money for an individual to spend on something that will probably be used only once or twice. On the other hand, in an environment where several people could use the package, it might be worth the price.

These disk prices sound amazingly inflated (except for the HP disks). Here,
the quoted prices are $49/10 for Memorex and $59/10 for Hewlett-Packard.
The local Byte shop is marking their Apple disks at $50/10 which seems to
correspond to the prices charged by a number of other local outlets.

Lines: 41

Seems to me one could do the speaker tweaking without slowing down the
VTP (virtual terminal program) in the following way:

When a bell char comes in, put a selected non-zero value in a global
cell. The value determines the bell length.

In the "main loop" of the program, typically:

```
   DO FOREVER
      IF <anything in serial line uart receiver> THEN
         <Display one character on screen (or function, or whatever)>
      IF <anything in keyboard input port> THEN
         <Send char to serial line, maybe echo>
   ENDDO
```

put in a test that, if the global cell is nonzero, "touch" the speaker
toggle and decrement the global cell. Eventually the cell will be
decremented to zero again, and the bell will stop.

If another bell comes in during this interval, one can stuff the constant
into the cell again, and get a slightly longer bell.

If the main loop is very short you might only want to do this every
"N"-th time through the loop. You also might want to uncouple the
time constants for the "touch" and the decrement, for example, touch
the speaker every 10 times through but only decrement every thousand
times through.

Extending this scheme to have several bells of different duration and
frequency are left as exercises to the student... :-)

The problem with linefeeds is much harder since you have to decide what
to do if you get a linefeed during a scrolling operation. At the worst
case (scrolling a screen all the way with linefeeds) you could actually
clear the screen and be done with it! Seems to this humble hacker that
there should be a data structure in which you could modify the information
on the fly (between row-moves) and restart the algorithm. Something like
"gosh, we have 3 linefeeds at this point, so this row needs to go *here*".
I haven't really thought about it that much...

Craig,

Might the game you spoke of be called "COMMBAT"? I have a game called COMMBAT from Adventure International that I bought several years ago. I have an Apple //. I have had one for 4-5 years now. When COMMBAT was first released, it was available only for the TRS-80 model one and three. I bought it anyway. It was the first multi-player, multi-computer game I had ever seen for personal computers. I wanted to read the instructions and possibly write an Apple version of it that I, of course, never got the time to do.

Adventure International made me proud to be an owner when about a year after I bought the game, they released Apple and Atari versions of it. They have an unusual way of selling it. It is, after all an unusal product. When you buy COMMBAT, you get all the current versions for all the computers it is available for. I called AI and told them that I had purchased the cassette version of COMMBAT for the TRS-80 about a year earlier. They said "No problem, send it in and we will update it free." The update I received contained the Atari Cassette and Disk versions, TRS-80 Model one and three cassette and disk versions and the Apple // disk version.

COMMBAT is a real-time, hidden-movement, two computer, two player tactical war game. The premise of the game is that sometime in the future, warring societies put equal combat forces inside a fenced off area with equal armaments and defenses and allow them to battle it out to decide the victor. Each player in the game manages the resources of his base and tries to find and destroy his opponent. Games over modems can take several hours. I have found games between two locally connected personal computers (at 9600 baud) to be the most fun. These games can take less than 20 minutes to play and are fast and furious. The game is easy enough to get playing after one read of the manual, but complex enough so that you are always finding new techniques and statagies to try. There are no graphics, and the display itself is not impressive at all but, the game design is very good and I find it extremely playable. If this is the game you spoke of, a call to Adventure International should get you current pricing. If you have several game oriented freinds with modems, It would definitely be

worth it.

Seymour

Those users who need the speed in scrolling should
consider using on of the 80 column cards designed for
the Apple][+.
The slow scrooling is particularly bothersome when using a
spreadsheet so I got a Micromax 80 column card that fits
in slot 3. Of course you cannot use the
Apple
card in the Auxiliary slot at the same time. Also using
one of these cards will not allow you to use double wide
lo res or double hi res(with the extended cards only), nor
will it permit 80 columns on an rgb monitor because of the video
not being on the motherboard where an rgb card looks for it.
Consider your application. Perhaps its a worthwhile investment for you.

Friends,

I'm trying to bring MDM730 up on a Franklin ACE 1200 in the CP/M mode.
Unfortunately the Franklin-provided literature is not very complete.
In discussing the serial interface card, it describes several calls
you can make to get a character from the serial port or send a character
to the port ... but that is NOT enough for practical purposes!

I need the actual memory address of the send and receive port (should
be the same), and more important - the masking values that I use to
determine if (1) a character has been received, and (2) if the send
buffer is clear and ready to receive a character for a send.

I have values for various Apple serial cards, but ALL are just a wee bit
different - don't really want to try trial and error: so inelegant!

Once I get this rascal up, I'll post the MDM7nn overlay on INFO-CPM
and INFO-MODEM7 (I think), and will let you all know too if interested.

Regards,
David Kirschbaum
Toad Hall
ABN.ISCAMS@USC-ISID
ps: I don't own a Franklin, just helping a buddy.

Has anyone out there actually hot-rodded his Macintosh to 512K? We're
about to, soon as we find out for sure which jumper to switch. Any data
on that would be appreciated.

From: James Byrd <jbyrd@BBN-VAX.ARPA>

Someone a few days back (I don't remember who) pointed out that Apple has
come out with Apple Access, a terminal program that claims to have vt100
compatibility as one of its options.

The vt100 compatibility claim isn't true. For one thing, the manual only
claims that it implements "most" of the vt100 features, whatever that means.
To see it fail pretty badly, try this: dial up to a computer that has an
emacs editor, call emacs on some file, split the screen, and use "escape z"
in the lower window a few times. As soon as the text starts to scroll down,
the display falls apart. Other examples are easy to find.

The package would be a LOT more more useful if Apple had actually
implemented the vt100 commands. As it is, I'm not sure what it's emulating.
It seems only marginally useful for trying to use a screen editor which
thinks it is on a vt100.

The //e ROM listings are in a 54-page supplement to the Apple //e Reference
Manual. The supplement includes the new 80-column firmware and support
routines (Cxxx space), plus the //e version of the F8 ROM (but not Applesoft

BASIC).

The Reference Manual itself costs about $50 and contains about 260 well-written pages of useful information about the machine, the 80-column cards, the bank switching, the soft switches, peripheral card conventions and the interrupt system.

The ROM listings are complete with comments and (in the case of the F8 ROM) conditional assembly directives to show the differences between the //e and II+ versions. The 80-column firmware has separate driver routines for Pascal and for Apple DOS, which share common subroutines.

One of the many things you can learn from studying the listings is that interrupts are disabled part of the time during scrolling (long enough to cause problems at 1200 baud). In another article I'll describe how I got around this problem, and a possible alternate approach.

>I spent about 3 hours working with a Mac and cannot see any justification
>for characterizing it as slow.
>All screen operations are very fast and the inherent CPU power is far
>above IBM 8088 based systems. I use a XEROX Dandelion at work and can
>say that as a mouse/window based system the Mac is superb.

I agree that the Mac is a supperb machine in many ways, and in fact represents an improvement over the Xerox technology (for example, in marking text to be moved, which involved holding down the button and moving the mouse on the Mac but two mouse button clicks on two

different buttons on the Xerox).

However, screen speed isn't everything. For reasons I cannot fathom, the Mac shares with the Lisa a serious speed problem in switching applications. If one of the ideas behind the Mac is being able to integrate applications, it seems very limiting that one cannot quickly move from one to another.

The Mac will someday be a great machine, I hope. Right now I consider it an impressive prototype with limited uses (overhead transparency production is a very good application).

By the way, what word processing program is your friend using?

I recently posted a note asking if there is something intrinsic to the Apple disk recording scheme which make it slow, or whether it is simply coincidental that Apple DOS and the Macintosh's system software share brain-damage that slows down the disk access.

Ross Alford (alford@ecsvax) responded describing a program he had written in TURBO-PASCAL for the Apple under CPM that read a ~40K file in ~10 seconds. It then took ~20 seconds of computing. He mailed me that program, and I ran it under TURBO-PASCAL on PC-DOS 2.10 (with the disk parameter table patch). It took ~20 seconds to read a ~50K file, and another 10 seconds to compute.

It looks like

a) Apple drives are not intrinsically slow
b) insofar as Apple disk access is slow it is the fault of the Apple operating system
c) The IBM-PC is half as fast (assuming that TURBO-PASCAL makes a good benchmark comparison, and that DOS 2.10 isn't inflicting too much overhead on disk I/O)
d) In one (possibly typical) application the IBM-PC seems to compute approximately twice as fast.

There are no "good" graphic adventure games for the Atari computer. All
of the good adventures are text only and they are all from Infocom. I do
own about 8 graphic adventure games from Serria, Scott Adams, etc., but
they don't hold a candle to the "real" adventure that comes on a disk
from Infocom.

The above is the opinion of the author, and is correct.

Don't make any assumptions about the speed of the drives on an Apple II
unless you have used Apple Pascal. It is a MUCH faster disk operating
system than (*choke*) Apple DOS. It is also faster than CP/M.

<ERROR CODE: no error>

Today I picked up an issue of ST. MAC (I'm still waiting for the third issue of MACWORLD). This magazine is better than any previous reviews of it posted on the net. It was professionally done and while the articles did not go into all the detail I would have liked, the variety of articles in a single issue was nice.

Here's the good part; ST. MAC is giving complimentary subscriptions to Mac and Lisa owners. Here is a quote from the magazine's credit box:

FREE SUBSCRIPTIONS: Complimentary trial subscription to all owners of Lisa and Macintosh computers in the U.S. and Canada. If you own a Lisa or Macintosh, send your name, address, and serial number of your machine to ST.Mac Circulation, Box 7041, North Hollywood, CA 91605. Please allow six to eight weeks for processing. ST.Mac is totally independent of Apple Computer, Inc.

Whether you like the magazine or not, you can't beat the price of this offer.

I am not connected in any way with ST.Mac magazine.

There are lots of ways to give yourself a REAL FULL keyboard, on your
Apple.

One way is to connect any cheap fully encoded ASCII keyboard to your
present 16pin socket (A7) on the Apple motherboard. You will have to be
sure that there is a keyboard stobe (positive pulse) at pin 2 for each
key press. Just hook up the proper TTL lines to the proper pins. Check
out the Apple reference manual
     The problem is you may end up not having a RESET key, then, and
     the left and right arrows may not be correct (you could use ctrl-H for
     left arrow, and ctrl-U for the right arrow).

Another way is: to buy an aftermarket Apple-type fully encoded ASCII
keyboard. These can be found in price ranges between $75 and $400.
There are some fairly decent ones for about $150. Almost always these
keyboards give you some real nice features too.

Another way is: to buy a new encoder board (assumming that you have one
of the later 2-piece keyboards). Replace that old encoder board, which
hangs under the keyboard and above the motherboard, with a better one
made by Videx. That gives you full ASCII keyboard, plus some real nice
things, like macros and automatic repeats.

Or you can modify your present encoder board (assumming that you have
one of the later 2-piece keyboards). There is already a cheap way to
add one DPDT switch to it and get an UPPER/lowercase keyboard with the
shift key really working. Look at the board and you'll see a place to
add a switch, after you cut some etches that are already there. There
are still about 10 keys you won't be able to enter (like {}|\ etc.) but
you'll be real close and you can't beat the price.

A problem you'll have with all of those solutions will show up when you try to enter lowercase characters in Apple DOS or AppleSoft. There is a small bit of code, in the monitor, called CAPTST, that converts any lowercase characters to UPPERcase. Here you can either buy or make your own modified monitor or simply load the Applesoft and monitor into your 16K card and change location $FD83 to $FF (unmodified $FD83 is $DF). Doing this you can then enter lowercase in Apple DOS or AppleSoft. By the way, most word processors and applications packages requiring lowercase, CP/m is another, do not use the Apple monitor, thus there is no problem caused by the $FD83 being $DF. I say that because you usually don't need to modify your monitor since those applications packages can read your UPPER/lowercase keyboard directly, they don't care what kind of monitor (whether or not it converts lower to UPPERcase) you have.

Another problem you will have in regular Apple 40 column mode is that you will not be able to see lowercase characters unless you have a lowercase display chip. Such as a Dan Paymar or, as I recommend, the Lazer Lowercase Plus board.

What will you see if you don't have lowercase?   abcdef looks like
!"#$%&

Without having a lowercase keyboard how can you see if you have a lowercase display chip? Enter this simple one line:
```
PRINT CHR$(100)
```

If a lowercase "d" prints, you have a lowercase display chip. If a "$" prints, then you don't have a lowercase display chip.

A more extensive test would be to print all the displayable (non-control) ASCII characters. Enter this program:
```
10 FOR A = 33 TO 127
20 PRINT CHR$(A);
30 NEXT
```

RUN
You should see is all the characters;
starting at the special characters !"# and numbers etc.,
through the UPPERcase ABC's etc.,
next getting the special characters [\ ] ^ and underline,
and finally going into the lowercase abc's,
ending with the last special characters { | } ~ and RUB.

```
!"#$%&'()*+,-./0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}~
```

Chuck

Well, I am going to assume that all new adventures for the apple, will
soon be available for the pc, and the rest... Infocom is decent, but
it doesn't have graphics! And so I would have to say they are not worth
the money. They have a new adventure called Seastalker that is better
than the Zork series, but not much, basically the same old stuff.
     There are a couple of new graphic adventures out for the apple,
Expedition Amazon for one, Secret of Easter Island for another...Not
on the market yet...but soon.

From: James Byrd <jbyrd@BBN-VAX.ARPA>

I've run into a weird problem, and I'm not sure where to begin on solving it. I have a IIe revision B, and a Microsoft Premium Softcard IIe (80-column 64K CP/M), Super Serial Card, and Duodisk controller.

I have a copy of Apple Access (a ProDos-based disk), and I've run into a strange problem I've never seen before. When the disk is booted, it normally shows one text screen (all in 80 columns), then a second one, and finally gets into the program. What often happens instead is that I get the first screen normally, but then I get garbage overlaid on top of the second screen. One fourth of the character position have garbage characters, in a regular array (every other position on every other row). Not only that, I get a sequence of a musical note(??!) repeated a few times.

If I just try rebooting or power-cycling, I tend to get the problem again. One thing that often works is to run self-test (control-closed-apple-reset), and then boot.

I've never had any problem with my Microsoft card on any other disk, but I'm tending to suspect the card. Can anybody give my any ideas as to what to do to solve this one? I'm stumped.

Jim Byrd

I was told last week by local Apple marketing rep. that increasing from 128K to 512K requires a new PAL, as well as memory chips.

Can anyone comment on this?

I don't know how the Mac does it, but the Apple][DOS places data on
the disk sequentially backward, thus:

Imagine a 16-sector file, ie one track, to be saved on a freshly
initialised disk. This file will be stored in this order on the disk:

File sector	Disk track/sector	File sector	Disk track/sector
1	18/15	9	18/ 7
2	18/14	10	18/ 6
3	18/13	11	18/ 5
4	18/12	12	18/ 4
5	18/11	13	18/ 3
6	18/10	14	18/ 2
7	18/ 9	15	18/ 1
8	18/ 8	16	18/ 0

...and so on for longer files. What this means in terms of read/write
time is that a simple-minded DOS can have lots of time to read a sector
into a buffer area and then move it to the proper area in memory, and
then do housekeeping before the next sector comes along, almost a full
revolution later. Thus, it takes DOS 3.3 18 revolutions to read that
16-sector file. SLOOOOOOOWWW!!!

There are several third-party DOSes available for the Apple][machines;
three that I know of are Diversi-DOS, from DSR, Inc.; ProntoDOS, from
Beagle Brothers; and David DOS, from David Data. All of these are
smarter in that they don't need the massive amount of time between
sectors. They use a little intelligence to read sectors out of order,
and all of them can load a 16-sector Applesoft or binary programme in
only TWO revolutions. Text file handling is a little slower but still
vastly faster than DOS 3.3. All of these DOSes also include extra
functions, some of them rather nice; David DOS has new commands for
direct load and save of text files, Diversi-DOS has a TLIST command that
lists Applesoft directly from the disk, and so on.

Cheers,

Dick Binder   (The Stainless Steel Rat)

There have been a number of reports of disks becoming unavailable. By this I mean when you insert the disk to open it, the system crashes with ID=02 error. The disk is unavailable in that you cannot even erase it!

There are two ways of getting around this.

Number 1: If you have MacPaint/MacWrite documents on the damaged disk, get into MacP or MacW and close the window and click on the OPEN selection in the file menu. EJECT the MacP/W disk and insert the damaged disk. This SHOULD be successful and you can save the file on another disk.

Number 2: You can try to repair the disk in the following manner. After booting the system with the system disk, eject it. While holding down the OPTION and COMMAND keys simultaneously, insert the damaged disk. The system will then try to repair the disk. You will lose, however, all of the folder hierarchy. Files inside the folders will be okay.

Number 2 came from Apple Technical Support, number 1 I found by experimenting. Apparently, acc. to ATS, the problem is due to addressing problems in setting

up the file-display windows (w/all of those pretty icons.)

That's all folks!

I just got an Apple II mouse,,, It took long enough for the
store to get it... It works great, MOUSEPAINT is very good
and REALLY supper from a ram-disk...

Does anybody know what the format of the FONT files is??

I have a bunch of font data that I would like to use, but I need to
know what format it should be put in so that MOUSEPAINT can use it..

Only one major complaint about MOUSEPAINT!

You MUST go back to the keyboard to clear the screen... This is a very
big pain!!! If it had the simple double click that MACPAINT has it would
be much better..

Another question...

What is the Motorola 87335 chip that is on the interface board, it is
as 28 pin chip... I was under the impression that the interface had
its own microprocessor on the board, but I cant confirm this, unless
the 87335 is a micro...

I am in need of a program that will take a Wordstar document file and
a list of footnotes and format the pages such that the footnotes end
up at the bottom of the correct pages. About a year ago there was a
company called Digital Marketing selling such a product, called
"FOOTNOTE" but it appears that they have disappeared - have not seen
an advertisement in nearly a year. I need this for IBM machines
preferably but could work with one for Apple/CPM if necessary. If
you know of such a product please respond by mail. Thanks.

Sorry, screwed up. Besides St. Mac, the same company publishes SoftTalk for the Apple II* (200-300 pages) and SoftTalk for the IBM pc (~100 pages). Furthermore, they publish St. Game which is a game magazine for all microcomputers. All of these magazines have a free 1 year trial subscription offer. Just simply give them your name, address, which computer you own and the serial number.

< another bug bytes the bus (Is this bug still around?)>

I spent the last few days creating what I think has to be the
 fastest memory clearing routine found. The way it's run
 is that you put the starting page in the accumulator and the
 ending page into the x-register. Then you put what you want all the

locations changed to in location $30. When this is done you JSR to the routine.

ROUTINE (I added the hex codes for those of you who don't have a assembler):

```
1  ; A<=page<X
2               ORG $800
3  CLRMEM:
4               STA POSIT+$2    800 : 8D 09 08
5               LDA COLOR       803 : A5 30
6               LDY #$00        805 : A0 00
7  CLRLOOP:
8  POSIT        STA $2000,Y     807 : 99 00 20
9               INY             80A : C8
10              BNE CLRLOOP     80B : D0 FA
11              CPX POSIT+$2    80D : EC 09 08
12              BNE CLRLOOP     810 : D0 F2
13              RTS             812 : 60
14 COLOR        EPZ $30  ; Note : if you wish to use this for low resolution
15                       ; just put the color you what the back ground
16                       ; to be in the accumulator and JSR $F864 to set color.
17              END
```

SAMPLE runner (a faster GR routine):

```
1               ORG $4000
2               LDA $C050 ; set low res screen
3               LDA $C053
4               LDA $C054
5               LDA $C056
6               LDA #$14
7               STA $22   ; set screen boundary so that you can only
8                         ; print on the bottom 4 lines
9               LDA #$07
10              JSR $F864 ; set color to light blue
11              LDA #$04  ; starting page
12              LDX #$08  ; ending page
13              JSR $800  ; mem-clear routine
14              RTS
15              END
```

The above would set the low - res screen, make it light blue, and return control to the calling program. This is so fast that it can be run 6 times in the time that the basic GR command runs(We clocked it).

I would like to see if anybody can make a shorter and/or faster routine then this (no, you don't win anything except my respect). Also, does anybody have any routines that I might want to look at?

Tom:

I tried to fill out the survey form, but found it impossible. Explainations are necessary. To the first question: For an excellent game, with challenge, Infocom is the only manufacture. If pressed I might add Scott Adams, but there are great flaws in the logic of those games.

Question 2: The Best Game Overall Game" In orger of my preference: The "Zork" series, The "Enchanter" series, The "Mystery" series. These are all from Infocom.

Question 3: "The Most Difficult Game" This question can be taken either of two ways. One, the most difficult because of flaws in the logic, which is bad. Or, the most difficult because the logic is flawless and puzzles are difficult, which is good. On the first count, number one is Scott Adams followed closely by Serria On-Line. On the second count, my answer is Infocom, of course. In the difficulty field I will also include, Empire of the Over-Mind from Avalon Hill.

Question 4: "The Most Humerous Game" Again a game from Infocom, "Planetfall". But add any and all of the games from Infocom, they all contain both covert and overt humor.

And finally question 5: "The Most Realistic Game" What kind of question is this? Realistic? Adventure games are not realistic, they are escapeism. When I play an adventure game I want to forget about the real world. But, on the other hand, if you are asking if the game in question is real to the realm of Fantasy Role-Playing, then Infocom is the most

realistic. And, the closest thing that I have seen to Advanced Dungeons & Dragons (AD&D) is 'The Temple of Apshi' from Epyx, and the 'Dunzhin' series from Screenplay.

All of the information is based on my personal experience after five years of playing AD&D, seven years of playing games on Unix, and three years of playing on my Atari 800.

The above is the opinion of the author, and is correct.

Can't agree with C. Malloy. I think there are several good graphics adventure games tht run on the Atari (there are lots of not-so-good too). "Wizard and Princess" is pretty good. The Ultima II and Ultima III pair are combination text/graphics games that are excellent. Depends somewhat on what you want and whether the person(s) playing are experienced in this type of game or not.

But, I will agree that the Infocom games are super, in the text adventure group they head the list and, as a whole, their games are better than the graphics group.

For something unusual, look into either "hercules" or "Ali Baba and the Forty Thieves". Not classic adventure games, these are fun and graphically oriented games that are less puzzle solving exercises than the other, more typical adventure games.

Have fun. (Why not post your query to Info-Atari at SU-SCORE?)

Who cares if it doesn't have graphics!!! That's like saying you didn't
like a book because it didn't have pictures. It just isn't possible
given an Apple sized disk to have both a good adventure game and good
graphics. And who wants to wait 10 times as long for the computer to
draw a silly picture with people that look worse than saturday morning
cartoon characters anyway. I'd much rather have an imagitive
description. What hath TV wrought?

e.

But in this case, the processor only has to check for an incoming
character once every 8 millisecs, and it can check for this any
time in that interval.

So, write a polling routine that checks to see if a character
has come in, and if it has maintain a spooling buffer for
unprocessed characters. Then write the routine to process
the characters interspersing calls to the polling routine
so that the polling routine gets called at least once each
8 millisecs.

You could add another feature to the polling routine that
checks to see if the spooling buffer is nearly full.
If it is nearly full, send the host a control S.
When it is empty and a control S is pending, send a control Q
to restart the transmission.

right?

This would be applicable to 70col hires character generators as
well. So if 70 columns are enough, you don't even need an 80 column
card.

The size of the polling routine would be small, although
some ram would be necessary for the spooling buffer.

To question 5, what about the Wizadry series and Ultima III? I consider
Ultima III tens time better than Temple of Asphai. In at least one magazine,
both of these game are ranked the highest among role playing games.

I believe there's a 6805 on board, but I don't know if 6805 = 87355. There's
also a couple of ROM's on the board. One is for the Apple's 6502, so the other
one must be for the 6805. I wonder what the program for the 6805 looks
like. Anyone care to find out?

The book you are looking for is "Apple II Monitors Peeled", Apple product number D2L0013 (950-0018). I don't know the price, but it's outrageous, as usual. I don't know if the book has been updated for the //e and //c monitors; it was written around 1981 by someone outside of Apple, I think. Having a hardware reference manual for your Apple is a must, since it probably contains a monitor listing to which you will need to refer if you use A2MP.

Regarding making sure your polling routine gets called at
least every 8 msecs: this is the whole problem...once your 80-col card
ROM gets into its scroll routine, it's hard to get control again.

Easier than interrupts is relocating the whole ROM code to RAM and
sticking calls to your polling routine in all the right places.

Regarding sending ^S to the host automagically: it's yucky,
it's awful, and it only works if you are *extremely* careful.

> Infocom is decent, but it doesn't have graphics! And so I would have
> to say that they are not worth the money.

That's just the point!! Infocom's adventures DON'T have graphics. You
have hit upon the essential difference between comic books, which have
all those pretty pictures, and serious literature, which doesn't. The
magic of Infocom games is that they draw you in and make you IMAGINE a
scene rather than feeding it to you like so much pablum in a spoon.

LONG LIVE INFOCOM !!!

Cheers,
Dick Binder   (The Stainless Steel Rat)

I have gotten some mail asking how to obtain the ROM listings I mentioned
for the //e. I got mine from an Apple dealer. Ask for the "Apple //e
Reference Manual." The ROM listings come packaged with the manual.

The entry to the Pascal output routine is JPWRITE at $C357. Most of the
work is done by PWRITE at $CA8E. A table at $CC5F controls the processing
of control characters. I duplicated the driver routine in my terminal
emulator and made a few patches in the control character table wherever
I wanted to handle something differently from the ROM, or add new capabilities
such as tabbing, or insert/delete line or character.

My first attempt to handle the scrolling problem was to write a transparent
subroutine (preserves registers and flags) to check for incoming characters

and place them in a buffer. I modified the scrolling routines, the bell routine, and a few others to call the polling routine at appropriate intervals. This helped, but I was still losing a character here and there. I tried adding more calls to the polling routine, but things were beginning to get out of hand and I was still losing characters. I decided to simplify and go to interrupts.

I turned my polling routine into an interrupt handler and removed all the calls I had inserted. In some cases I was able to remove entire subroutines and go back to the ROM version (the BELL routine, for example). The result was much cleaner code and it worked the first time.

As I mentioned previously, the //e ROM disables interrupts part of the time during scrolling. To be precise, interrupts are disabled whenever text page 2 (in the alternate bank, sometimes called page 1x) is swapped in. This happens because text page 1 contains some memory locations which are not mapped to the screen and which are reserved for use by the peripheral cards (see chapter 6 in the Reference Manual). Apple assumes that an interrupt handler might need to access some of these special locations, and that handlers from pre-//e days might not know about alternate banks.

My interrupt handler does not use any locations on text page 1, so I just leave interrupts enabled while page 2 is swapped in.

< clean your plate; there are bugs starving in asia... >

Thought I'd share two nasty problems with Microsoft BASIC on the Mac.

1) When saving a large program (by selecting SAVE from the FILE menu),
one must wait for the disk to finish spinning before selecting another FILE
option (especially NEW, OPEN... or QUIT). Otherwise, the disk write is
truncated. This happened several times before I made the connection.
I sent Microsoft a bug report on this one.

2) A large quantity of LPRINTs can overrun the Imagewriter's buffer if the
printer is set for XON/XOFF protocol. Selecting DTR protocol (by opening dip
switch 2, bit 3) fixes the problem. I haven't tried MacWrite or MacPaint with
the printer in this mode, but I suspect there will be problems since they worked
fine with XON/XOFF.

To the best of my recollection, someone posted this and said
that inorder to change to lowercase input one had to change
location FD83h from DFh to FFh.

I have never tried this and cannot verify it. Perhaps someone
else can.

Regards.

You have only uncovered the surface, by no means does Microsoft BASIC even come close to utilize Mac's power. Some of the things Microsoft screwed-up on are:

- When you do an OPEN, you are faced with a single blank box you are supposed to type your filename into. NO scroll bars containing a list of the filenames, NO way to easily access a second drive. This is fine for the IBM-PC, but NOT the Mac.

- No COM statement to configure the communication ports. You have to poke in assembly programs to do this.

- No sound support of any kind. (Unless you count ^G :))

- Small working space, <20K if you want the desk accesories to be reasonably responsive.

- No way to size the output window from within the BASIC program.

- LPRINT doesn't configure the printer port correctly, you must do a screen dump before you do a listing so the XON/XOFF handshaking is performed.

- When you do a RENUM the listing window gets burried. agrivating!

- No way to cut and paste groups of lines within a listing. I realize that this is tricky with line numbers, but it can be done.

Whew! I feel a little better getting that off my chest, but Microsoft!! you can do better, MUCH better. Unless you want sales to drop to zero when the next language comes out, please bless us with an update that makes MS-BASIC a program for the Macintosh, not an IBM retrofit.

Awaiting for 'C' also

Does anyone understand the modem7 transfer routine selectable
from within the Mac? I suspect that this is a variation of the
protocol for umodem. Please reply via mail and I will post
the results.

Modem7 is described in INFO-MODEM7@SIMTEL20 as
the "CP/M MODEM7 Christensen protocol file transfer program".
This is exactly what you find under a description of umodem
(except ,of course, for the modem7). I tried running umodem,
but the Mac file transfer routine timed out! I can modify
umodem.c, but what hand shaking does the Mac need? Thanks.

<...>
     I don't see what al the fuss is about? What exactly do you
     want to do that needs to be faster? I have written several
     large applications on Apple computers using Apple pascal and
     the only real bottleneck I have encountered is Disk I/O.
     The solutions to that are hard disk or ram disk. Both are
     available. Given the limited memory space of the apple II
     series, I happily trade off the slower execution speed for the
     reduced size of P-Code vs compiled code. Better than swapping
     segments in and out all the time.
     Apple Pascal provides lots of low level built in functions
     and procedures if you need to speed up I/O. Other things that
     just have to be faster, can always be done with the assembler.

I have flipped all the blank floppies I've ever owned and had very few
disk errors (even with ultra-cheapo floppies). I don't know how
scientifically founded the criticisms are that discourage flipping floppies
but I have had great luck!

Some hints:
     It's easier to cut out the write-protect hole with a paper punch then
     with an exacto knife (sure the hole's round, but who cares?)

     Instead of measuring where the hole should be punched, just take
     another floppy, put one on top of the other facing each other,
     and now use the the real hole of one floppy to line up the punch
     for the new hole of the other.

"BASIC Programming With ProDOS" is well worth its $30 price tag. A great number of changes and additions have been made to the ProDOS enhanced Applesoft. So much so that it is worth your while to switch to ProDOS if you must do any significant amount of work/programming in BASIC on the Apple (please, no flames about using BASIC!...Even though I mostly program in C and APL these days, BASIC still has a place in my toolbox).

Here are a few things I did not know until reading the manual.

-you can store all variable values in an active program by issuing a STORE instruction
e.g., PRINT D$;"STORE /MYDISK/VARFILE"
-the RESTORE instruction retrieves the STOREd variables from a disk
-BLOAD can now load the binary image of ANY filetype (Applesoft, text, random access, etc.)
-READ and WRITE can now access any filetype. It can also grab the directory since the directory is treated as a filetype too (does this sound familiar UN*X fans?)

Along with the book you receive a disk full of sample programs and data files. One of the more interesting programs is APA. This is the ProDOS version of the APA (Applesoft Programmer's Aid) that was part of the Apple DOS Tool Kit for DOS 3.3. This utility adds auto line numbering, renumbering, REM removal, and other useful programming aids.

There seems to be a problem with the XREF function in APA though. If you issue an XREF right after BRUNning APA, it sends the Apple into never-never land. I found that the following technique is needed to use XREF

(note that '-' is a universal execute command in ProDOS...It will RUN, BRUN, or EXEC as appropriate)

-APA

```
     LOAD BASPROG
     COMPRESS
     XREF
```

I don't know why COMPRESSing (removing REMarks) lets the XREF to work, but if you issue a COMPRESS once, XREF will work every time thereafter.

This technique was tried on three different Apple configurations. The same results were found. Machines used were:

```
     Apple II 64K (with old monitor ROMs.  Applesoft ROMs were swapped in
                   how many of you remember the Applesoft ROM board?)
     Apple II+ 64K
     Apple //e 128K
```

I also took a quick look at the ProDOS Tool Kit ($75) although I did not buy it. The Tool Kit contains a 6502 assembler and what appears to be a very sophisticated editor. The editor is capable of split screen simultaneous multiple file editing (say, doesn't all this REALLY remind you of something you are all familiar with?)

Now, unfortunately, another long wait is in store for me as I wait for the manual which will tell me how to hook machine language programs into ProDOS and where to hide them in RAM.

Incidentally, easy-to-use compiler-compilers for top-down languages HAVE
been written in the past. The "META" class of compiler-copilers got some
attention for a while. I once got a copy of an Algol-W compiler that had
been written with "META-II", and the distribution (from DECUS for the PDP-10)
included the full "META-II" package, so I played with it a bit. I was able
to write a compiler for a toy version of BLISS (took most of the language
but the generated code was *AWFUL*) in a weekend.

In META-II, you write the grammar with imbedded output rules. Once you match
a rule to the point of outputting something, backup is forbidden, so you need
to do a bit of munging to force (nearly) LL(1) prefix structure. Sample rules
(productions):

```
    expr:    "(" expr ")" | addop ;

    addop:   mulop "+" OUTPUT("push AC") addop OUTPUT("add @sp+");

    mulop:   mulop "*" OUTPUT("push AC") primary OUTPUT("mul @sp+");

    primary: integer OUTPUT("load ac,[%1]") | name OUTPUT("load ac,%1");
```

Each rule (production) was compiled into a recursive procedure, which
was called by the stack/backup control routine. Each literal string
was compiled into a call to 'match("string")'. The %1 notation was the
top of stack #1 (of 4), which contained the LEXICAL string most recently
matched (note the use in the rule 'primary'). (The stacks were actually
local stack-variables, in that there was a fresh set available on each
new rule invocation.) You could do ^2 to push onto stack #2, etc. Having
the four stacks around let you re-order the code generation for things like
'if' and 'case' statements. The 'OUTPUT' command was no more than a 'printf'
equivalant, so META-II-generated compilers output assembler source (like
C does).

However, once I had seen how they did it, I quit using META-II, and
started crafting my own recognizer procedures directly, using a small
library of things like 'match'. Given that "bag of tricks", small
top-down parsers are easy to whip up when needed.

I have posted the most recent (that I can find) version
of MacTEP, v 1.18, in net.sources. It runs 400+ lines.

This version HAS been improved.

This is my second posting of this. Doesn't ANYONE out there have
a Lisa with UNIX on it??? I have received a couple of indirect
pointers to information that I am following up. I'll post the
results in a week or so.

I am thinking about buying an Apple Lisa-2 for my very own UNIX machine.
(I can get a very good price on any configuration.) However I know
practically nothing about the machine. This is a query to obtain information
from real live Lisa-2 users. I will post a summary to net.micro of

what I get and am free to quote. Thanks for your help. Some questions:

What UNIX do you have and what do you think of it?

How is the support?

Can you reconfigure it? (Relink it?)

Can you run Apple software off the cassette and/or selectively boot
UNIX/Apple software?

Does the basic Lisa-2 come with an integral disk controller?

Is the disk interface something standard or is it a roll-your-own?
Can I plug in a Maxtor with mucho storage, or similar, into
the Lisa?

How is the performance?

Do you like it?

Lines: 34

I just filled up the last slot in my Apple //e system. I think that I
have detected a power supply problem where, in some cases, the standard
//e power supply doesn't quite have enough capacity. I have a super
serial card in slot 1, Micromodem //e in slot 2, 80 col--extended 64K
card in slot 3 (Aux slot actually, cann't use slot 3), Apple Mouse in
slot 4, Vista 8 inch controller card in slot 5, standard 5 1/4 controller

in slot 6, and a PCPI Appli-Card in slot 7.

I get a disk write error on the 5 1/4's when both drives are active (actually switching back and forth rapidly). I can work on the 8 inch drives "all night", or be reading from a 5 1/4 and writing to an 8 inch drive with no problems. I only have a problem when there is a program that uses both 5 1/4's (for example, [under CPM] using pip to copy one 5 1/4 to another).

This problem just appeared after I added the Vista card. I suspect that the total power requirements for the system exceeds the capacity of the power supply when both 5 1/4's are very busy. I am going to do some more checking by removing some of the other cards first (I'll leave the Vista card in to make sure that it's not a software problem).

QUESTION: Are there replacement power supplies that have a larger capacity than the standard power supply in the Apple //e. Thanks in advance for any assistance?

This has been discussed at LEAST 8,000,000 times in the last year
on this newsgroup. PLEASE folks, don't start it again!

.....

To summarize previous discussions on the matter:

There has been much give 'n take on this question and on the more general
one of using the back of single sided disks. The bottom line is no one
knows the risk. It depends on a lot of things like the cleanliness of
your environment, the quality of the disks, the amount of usage, etc.

If you clean your disk drive heads regularly then you will reduce the chance
of damage. If your environment is clean then there will be less dirt in the
jacket to cause trouble.

In any case, the danger is not immediate. It is a cumulative danger both to
the drive head and the diskette. You will have to weigh the cost of
diskettes against the number of backups you keep and the value of your data
to decide whether the gamble is worthwhile for you.

.....

Personally, I use el cheapo diskettes in my Morrow (DSDD). I also keep a
backup of EVERY diskette and I clean the disk drive regularly.

I appreciated getting the ARPA news on the mac. It is interesting
to see the heat and controversy it is generating.

The situation reminds me some of what happened way back in
1978 when I bought my Apple II. At that time a cadre of (largely
hardware) hackers had developed who were running 8080 systems, usually
S-100. In order to sucessfully use a computer at home then, you had
to really understand it and be able to configure the system and
write the software for it yourself, as well as make repairs, since
there were no real dealers.

For the first year or two after the Apple II came out, there was very little
software available (it took a year before even a single disk drive was
available). Many people recommended the TRS-80 because of its HUGE
excess of available software. However, the superiority of Apple features
such as graphics and an open system shifted the balance to Apple's favor
over the next 2 or 3 years.

The other change that the Apple II and the TRS-80 wrought was that
you no longer had to be smart to have a computer. This led to the
flooding of the computer clubs with novices and the driving out of
many of the clubs' founding hackers who got tired of continually
answering the same stupid questions. The moaning we are hearing now
with the advent of the mac is in someways analogous, I think.
The mac is the first computer that is so easy to learn how to use
that almost anyone can do it. I have recommended the Mac to a couple
of people who had a hard time understanding that they had
to press return after issuing an operating system command and
within a day or so they were in love with it, and using it productively.
The brilliance of the mac, I think, is that it adapts the concepts
flowing from the research at Xerox PARC that Xerox failed to market
sucessfully in the Alto, at least at a price that every person can afford.
The melding of a decent processor with intuitive software which can
be manufactured cheaply is Apple's breakthrough. I certainly may not
agree entirely with the present 128K, 1 drive and $2500 price configuration,
but it represents a rational marketing decision and the price will
surely come down if/when production can keep up with demand.
Remembering the Apple II experience, the software will probably
not be voluminous for a year or two, but this is unavoidable.
This is not to say the Mac is the computer for everyone. The BIOS hackers and
hardware folks can still have fun trying to get BSD UNIX up on their
16032 homebrew, but should recognize that it is computers like the
mac that are the likely candidates as a tool for everyman.

I was especially disappointed in Jerry Pournelle's attitude, which
seemed to me short-sighted for a person who professionally looks
toward the future (s-f writer). I hope his negativity is not
reflected so strongly in his BYTE column as to discourage novice
users from buying macs and that future software and hardware developments
will change his mind about the mac.

Well, I've shot off my mouth enough for today...

After seeing the messages about the upgrade from Apple's UCSD Pascal 1.1
to 1.2, I surveyed the local Apple dealers in the Seattle area and then
sent my diskette and money to the address quoted. The local dealers
were not aware of the upgrade (or at least claimed they were not aware)
as each quoted me the time-worn $250 price for the original purchase.
One Computerland rep even asked me why I would prefer Pascal to BASIC!!
A phone call last Monday to Apple Customer Service got me the news that
the initial distribution of 1.2 has resulted in a recall -- apparently
more bugs than they were happy with had been found. Their indication was
that a revised distribution would be coming out the first week in June.
Thought this latter might be of interest to others who had requested the
upgrade.

After reading the recent postings of INFO MAC traffic (for which I thank the poster) I can't help but respond to the tantrums of Jerry Pournelle regarding the Mac. (perhaps at the risk of repeating some things already said.)

Jerry appears to me to have evaluated so many pieces of hardware and software and looked so much at the flaws and problems of everything that comes into his hands, that he is losing the objectivity to see the good points. He is definitely at his best when he is fighting the Good Fight against venal software vendors for shoddy documentation, poor support, intimidating license agreements, and vile copy protection schemes, and I cheer him for those efforts. But it is possible that he has become so negative about the efforts of the industry (or, perhaps, certain players therein) that he is unwilling to see the good in anything as well hyped (and, admittedly, over-hyped) as the Macintosh.

I seem to remember that when the IBM PC first came out (and it was pretty well hyped, too, if I recall correctly), it didn't have very much in the way of either software or peripherals available for it, and IBM was quoted as saying that certain very desirable peripherals, for example, would be supplied by independent manufacturers. Ditto for much of the desirable software. And lo, now 2 years later, that has all come to pass, perhaps with a vengeance. So it isn't very surprising that Apple would do the same sort of thing with the Mac. This sort of thing is common in the entire computer industry (e.g. witness the history of DEC's VAX), and is nothing to get alarmed about, in my opinion, UNLESS the Mac totally bombs commercially.

I think it is significant that Jerry acquired a Mac in the first three months of its existence, but he waited until the PC was about 1.5 years old and had LOTS of hardware add-ons, support, and software available before he bought one and reviewed it. Fairness would dictate that he at least wait a year before seriously reviewing the Mac. Let's compare apples with apples (or with IBM's, on an equal footing).

I really enjoy Jerry's BYTE columns, and read them even when I read nothing else in BYTE. I expect to continue to enjoy them, but I will take what he says with a grain of salt. I will be interested in what he has to say about the Mac in his column, as opposed to what he said in this forum. The question of the hour is, "will he tone it down, any?"

I have an Apple //e with the Standard 80 col. card. I am thinking of
getting an extended 80 col. card and I would like to have some feedback
on which one I should buy.

By the way, as most of you know, the regular 80 col. card for the //e that Apple
makes is too slow to keep up with 1200 baud modem without a specialized driver
program. Please indicate if you have any knowledge of how quick the
card(s) are.

Thanks,
Ron Breger

     I recently purchased a Z-80 card for my Apple //e. It didn't take me

long to realize that ED has to be the *worst* text editor in the world! So my question is this: Are there any good text editors in the public domain? If not, what about commercially available editors? There has to be something better out there somewhere.

While I'm on the subject, is there a good source of public domain software somewhere? Any info is much appreciated.

Can anyone tell me how to bury control characters in a Wordstar file to control the various special features of a dot matrix printer such asdownloadable character sets, double size printing, character width etc.? There are four control characters associated with User1, User2, Use3, and User4 which allow doing this to a limited extent.

There is a fast language for the 6502!!!!!!!

A new language called ACTION! has been developed for the 6502. I have the
version for the ATARI system. The syntax is a cross between C and pascal
with the emphasis on pascal. Some of the nifty things in C are missing
but on the whole the language isn't bad. YES it does compile to native
6502 code, and yes it excutes very fast. The compiler is also very fast
This new language is supposed to be available for the apple machines also.

A rumor abounds that it will be ported to the IBM-PC on its 8088.

If you want a native code for the 6502 check it out.

I suspect that you won't get many responses re: Unix on a Lisa.
There just weren't all that many Lisas sold, and the intersection
set between Lisa users and netters is likely to be small.
Best of luck, though.

Manx Software will be releasing their Macintosh C very soon -- they will
now take your name and put it on a mailing list. Does anyone have any
specifics yet? If you want to get on their mailing list try them at:

     (201) 530-7997

I missed the original news article on this subject, and saw only
a discouraging reply. I know that there *is* a UNIX for the Lisa,
and it comes out of New Jersey. I just looked for the envelope
on which I had (several months ago) scribbled the source, and couldn't
find it. (It may have been purged in a recent cleaning of my desk.)
If the person who was interested is still interested, s/he should
send me mail, and I will get the information and pass it on.

Apparently some (non Mac users) are complaining of a lack of META, ESCAPE
and arrow keys to use with EMACS on a MACterminal. I'm not a macuser, but
I heavily use a similar interface constantly on a Xerox lisp machine.
Emacs is my main editor on VAX unix, and I use it both from ordinary
terminals (so I know and use most of the arcane keybindings) and from a

virtual terminal on Ethernet in a Lisp window. On the Lisp machine I do most of my cursor movements, scrolling, gross positioning and commands with the mouse, not from the keyboard. I move a few characters from the keyboard, anything longer with the mouse, including scrolling (both by number of lines and percent of file). Most of the commands I use are on menus surrounding the "terminal". Emacs has so (damn) many commands to provide lots of flexibility. The mouse subsumes most of them with a small set of paradigms. (By the way, it took only a few dozens of lines of lines of code in each of the Lisp machine and emacs to make it work. The programability of Emacs is quite worthwhile [for wizards, anyway]).

(clue to value of the mouse [to me]: it's got the only uncluttered square foot of surface area in my office)

There seems to be some confusion (this may be an understatement) about exactly what an Apple disk drive is and what it will do. This may be a bit technical, but here goes...

The mechanics (i.e. head, motors, chassis, etc.) of the Apple drives are equivalent to those of a Shugart SA400. Shugarts were used for a while, but reliability problems started cropping up, and they switched to ALPS drives. In any case, these are your standard, run-of-the-mill, 48 TPI floppy drives. Only 35 out of the 40 available tracks are used, probably because 35 track drives are cheaper, being older. The recording method used is FM. However, they pack 4K on a track, which is the same density as most MFM disks. In fact, if the Apple drive used 40 tracks and both sides (like some of the Rana and other drives), it would have 320K per disk, just like an IBM PC. Now, you may ask, how does the Apple get MFM data density with FM data rates and encoding? The answer is a very clever recording method called MGCR (stands for Modified Group Code Recording). Thanks to some wizardry (no lesser adjective is appropriate) on the part of Steve Wozniak, this is done with a handful of cheap chips (look closely at the Apple controller sometime).

The basic idea involved in FM is to have a stream of clock bits with a stream of data bits interleaved. MFM takes this and fudges with the clock bits (sorry for the lack of technical accuracy, folks), sometimes dropping them altogether in order to fit in the data. On the average, there are more flux changes per unit length, and thus a higher bit density. MGCR takes the data bit stream and breaks it up into 6-bit groups. It maps these groups to 8-bit groups (hence the name "group

code recording") which represent flux changes on the disk. No clock bits are used. Instead, each 8-bit group conforms to a simple set of restrictions regarding number of consecutive 0 bits and others (including the high bit being high (no pun intended)). These restrictions allow the nifto Woz state machine on the controller to keep track of everything and stay synced up. This technique is used for high-density tape drives and on the MAC. In short, it gives you double-density with single-density physical bit density (flux changes per unit length), and hence, greater reliabilty.

It's too bad everyone else uses flakey old MFM. Oh, well.

On the issue of 96 TPI drives, etc.:

The stepper for the head on Apple-compatible drives is controlled directly by the 6502. The existing code in DOS will step at 96 TPI even with a 48 TPI mechanism. Several copy-protection schemes rely on this so-called "half-tracking" ability. In fact, with appropriate incantations, you can step the head at 192 TPI. There's only one small catch: a 48 TPI head is twice as wide as the one on a 96 TPI mechanism. Therefore, a standard Apple drive will not quite handle 96 TPI. A 96 TPI mechanism will. This is the trick by which the Rana and other 96 TPI drives will boot and run 48 TPI (standard) disks without complaining. They look like normal drives, but can handle the higher track density. One wonders why Apple doesn't bring out 80 track, double sided drives. Again, Oh well.

Manx called back with information that they will be releasing their Macintosh C in late July. There will be two versions: a $199 "personal" version and a $500 "commercial" version. They did not go into the differences between the two and promised more information in their mailing. Ring them up at (201) 530-7997 if you want to get on their list.

For what it is worth, in the May 21, 1984 issue of
Information Systems News, there is an article:

"See Apple Dropping Apple III, Lisa II, by Philip J. Gill

  Although the company has officially denied it, some
industry analysts and former Apple Computer Inc. employees
said the Cupertino, Calif., personal computer (PC) maker
plans to abandon its Apple III and Lisa II models in favor
of the newer Macintosh and IIc computers."

  "... Omri Serlin, president of ITOM International Inc., a
Los Altos, Calif., market research firm, ... contends that
from all indications the life of Lisa II is likely to be
a brief one.
  Serlin also noted that Apple is only shipping about 2,000
Lisa units per month, which makes its contribution to revenues
at the $1 billion firm virtually negligible."

Any one want to comment on this?

This is a hardware question. I am trying to add a * REAL * * FULL *
keyboard to my Apple][+. I know there are $300 keyboards available,
but I don't want function keys, etc. I just want a full keyboard
which can plug into the existing Apple keyboard encoder. Is there a
way to use the $40 ascii encoded keyboards with my Apple.

                    Thanks, John Antypas

It seems to me that as long as a Lisa is needed to do serious Mac
software development, Apple will have to sell and support Lisa.
Any guesses on how long that will be?
Also the literature distributed to prospective Mac developers makes
much of the upgrade path to the Lisa and the extra installed base

available to compatible programs, indicating that they plan to
continue the product.
Why make a major upgrade of the product if it will be continued?
Besides, the price/performance is finally getting interesting.

> though it speeded
> up scrolling. My friend also said that turning off the
> cursor speeds up display quite a bit (if you look at the ROM code you
> see that the cursor is displayed twice for each character printed).

Why scrolling is slow:

   Turning the cursor on and off is not the problem. That operation takes
only a few microseconds, and you have something like 8.3 milliseconds between
characters at 1200 baud. Besides, when you scroll the screen you are only
worrying about the cursor twice (before and after), just as with any other
output operation to the screen.

   Let's do some arithmetic. To scroll the screen on the Apple, you need
to pick up 1840 memory-mapped characters (23 rows, 80 columns) and move them
to new locations, after which you clear the 24th row to blanks. At the
very least you need 1840 fetches, 1920 stores, and 1920 increment instructions.
On the 1.023-MHz 6502 you have already used up 5.5 milliseconds, which leaves
only 2.8 milliseconds for testing, branching, and recomputing base addresses

along the way. That certainly is not enough time for a "test and branch" after every character.

It might actually be possible if you do some clever loop unrolling, but that is going to take up a LOT of ROM space and it only solves ONE of the problems you have to face in order to function at 1200 baud. What are you going to do about the BELL character, which chews up something like a tenth of a second in buzz loops, just to tweak the speaker occasionally? What are you going to do about form feeds, or their cousins the "clear to end of line" and "clear to end of screen" operations, or the "reverse scroll" operation? The answer is NOT to write faster code.

The answer is to use interrupts, so that you can continue with your scrolling operations and not have to worry about losing incoming characters. You may get a few characters behind while scrolling, but you catch up very quickly when all you have to do is store characters into the text page.

Those bells sound a bit funny when they get interrupted enough times.

The figures quoted don't make a lot of sense; 2000 units per month at a minimum of $5000/unit equates out to $120 Million/year, hardly a "negligible" fraction of $1 Billion.

On a different level (and I do NOT claim to be a marketing expert!) it seems to me that a decision to kill the LISA II would be SILLY. At 2000 units

a month it is certainly repaying its development cost. Prior to January 24, I would have EXPECTED a discontinuation of the LISA I - too high a price for a "weird" machine (only the PARC freaks could get excited, and they knew it wasn't REALLY a "Dolphin").

But the II's are more machine for less money than the I's, and more to the point, the Macintosh ANCHORS the whole "Apple 32" line. This is even more the case if (as expected) the Mac drops into the $2k range to make room for the "fat mac" around the end of the year.

Where does one go when one outgrows one's Macintosh? The popularity of the Mac makes that question inevitable, and only Apple has an answer today (no doubt I will read in the WSJ tomorrow that Big Blue has announced windowing software for the PC, available 1Q86!).

(*sigh*) oh, damn...to any sensible observer it seems ridiculous that Apple would kill the LISA. Guess that means it's gonna happen any minute...

> From: henry@utzoo.UUCP
> This is actually an understatement. Error-handling is much
> easier in recursive-descent/LL(1) than in LALR systems like
> yacc.

I find this extremely hard to believe. It is amazingly easy to write a very good error recovery system for an LALR parser. In fact, I was able to write an error recovery system for an LALR Modula 2 parser in less than a day. And not only that, it worked much better than the error recovery in any other compiler I've ever seen. How much easier can you get?

What makes it so easy to do good and easy error recovery systems for
LALR parsers is that you have the parse stack directly available to you
and you can copy it and fiddle with it until you get something that
works. You can't do this with a recursive decent parser. Though, of
course, there are ways of doing error recovery with a recursive decent
parser, I can't imagine that any of them are easier.

I spent about 3 hours working with a Mac and cannot see any justification
for characterizing it as slow. The Mac I used belongs to a friend who is
writing his thesis on it and so far he loves it. The only annoyance seems
to be trying to get along with one disk drive. The Mac needs about 270k
worth of system code space on one drive and forces you to do a lot of disk
swapping when changing applications. A second drive cures the problem.
With more memory and double sided drives the Mac won't have the same behavior.

All screen operations are very fast and the inherent CPU power is far
above IBM 8088 based systems. I use a XEROX Dandelion at work and can
say that as a mouse/window based system the Mac is superb. If the $35k
Dandelion had the same price performance ratio I would be delighted.

I am amused by the widespread misunderstanding of the benefits of
the mouse and window interface. A knowledgeable and fast typing UNIX
user can be beat by a knowledgeable mouse/window/menu user any day.

Is this slick, wifty disk drive controller that uses only a few, cheap
chips to blame for the slow access speed of Apple drives? I didn't
really think that much of it on the original Apples, inasmuch as they
were doing an awful lot with just a 6502, but the Macintosh is *just*
as bad! Approx. 20 seconds to load an application! What in the world
it could be doing with all that time is quite beyond me. Could it be
that the Wozniak controller scheme is intrinsically slow for some reason?
Or is there some minor implementation problem here?

I am posting the following for Gil White, from the School of Medicine
here at the University of North Carolina. If you have information
that can be of help please contact him directly at 919-966-3311 or
send me electronic mail and I will hard copy it for him.

Gil White needs software to allow an Apple IIe to communicate (i.e
transfer files) with a TRS-80 model 4(P?). The communication link
is RS232 and the Apple has a Super Serial Card.

Or if you have information on how to run Apple programs on Radio
Shack computers.

Thanks.

I recently made a "discovery" about MacPaint which might be appropriate to
share, since it is not mentioned in the manual, and I don't recall seeing
reference to it in any article about MacPaint.

Use the selection rectangle to cut or copy a selection to the clipboard.
Open another selection rectangle and then select the paste function from
the edit menu. The selection that you previously cut will appear in the

new selection rectangle and it will be stretched or compressed to fit the new rectangle's size. Thus, there is an implicit stretching operation performed when pasting to a selected area. Did everyone else already know that??

 I have found a keyboard which can be attatched to an Apple with little dificulty. In the May 84 Byte Pge. 66 Jameco Electronics is selling a par. Cherry keyboard for $29.95 (I can find a case somewhere) and more than one person I have talked to said if you keep the cable short, you'll have no timing problem. (Even if you did, it's just a small 50 cent fix.) The entire job, keyboard, case, wired cable and apple 16 pin wired connector should take less than an hour so I'm told. Total cost less case $35

I started off with AE "Pro", but I now use "Softerm II" by Softronics. While AE "Pro" concentrates on macros and file transfer, Softerm concentrates on terminal emulation. They currently support over a dozen different terminal types (including vt102, which gives you char/line insert/delete). It does some uploading and downloading, but the macros are pretty weak. The best thing about it (particularly for Unix work) is that they now have a board that plugs into any slot, and gives you three extra buttons. This means that you never again have to worry about ^L causing your modem program to switch to all upper case, that is done with a combination of one of the new keys and the L. I have had Softerm (in various versions) for over a year now, working at 1200 baud, and have not had any problems. I highly recommend it. (Warning: it is not cheap, I think list is now bordering on $200)

How does one go about implementing floating point functions?
I have written a subset of a compiler and want to add floating point
a floating point library.
The question is- How does one go about implementing floating point
functions.
     I know if you wanted to implement sine, a quick and dirty way
     would be to have a table of values and interpolate those
     values that you didn't have.
     but, NO!!! that is the ignorant way. anyways, please give me
     ideas.
     (a maclaurin series maybe?!?)

New information and further reflection have led me to revise my opinion
on the feasibility of Pascal and C compilers for the 6502:

I've recently had the opportunity to play with Turbo Pascal (1.0) on my
father's Z80-based Morrow. Turbo Pascal puts local variables at fixed
addresses: if you turn on the compiler option for recursion it saves
the old values on a stack at the beginning of every call (just the way
you would do in Fortran). The manual implies that this is also
done in the 8088 version. As long as they're going to do it that way,
there's no reason why there shouldn't be a 6502 version also.

Using fixed addresses is a fairly reasonable approach although I think
arrays should be exempted for two reasons:

    You're going to have to calculate addresses anyway

    It is arrays that are going to occupy lots of memory--
    no one is going to declare a hundred different integers.

Furthermore, even allocating local variables on a stack is not as bad
as I originally thought. True, the 6502 will take more instructions than
the Z80 or 6809 BUT--
    the instructions are shorter.

Consider loading the accumulator with a byte from a location on
the run-time stack. Sorry, I'm not familiar with all the assembler
conventions, so the instruction formats may not be quite right.

processor	inst	bytes	cycles	explanation
6502	LDY #offset	2	2	put offset in Y register
	LDA (ind) Y	2	5	address is contents of Y plus contents of a 16-bit word on page 0
Z80	LD A, (IX+d)	3	5	address is contents of IX register plus an offset specified in the instruction
6809	LDA ???	3	5	address is contents of one of several registers plus an offset specified in the instruction. A short form can be used if the offset is 5 bits or less.

Thus the 6502 takes 4 bytes and 7 cycles where the other cpu's take 3 and 5.
This is a noticeable difference, but not the factor of 2 or 3 I had
originally suspected. Also, if the needed offset is already in the Y register
it doesn't need to be loaded again: this could be used by the += and
-= operators in C.

The 6502 will be at a disadvantage doing 16-bit arithmetic, since it has no
16-bit instructions. However, the Z80's indexed addressing mode cannot be
used with 16-bit instructions (no 16-bit indexed load).

Conclusion: compiling Pascal or C for the 6502 is difficult but not out of
the question.

This is a vote in favor of Quadlink and a comment about an apparently undocumented feature.

Our dept recently purchased 3 PC's, keeping in step with the rest of the University. However, we have a very large library of instructional software for the Apple II+, with one machine that has been serving as word processor, db manager, software design facility, and classroom demonstrator. The classroom use often conflicted with the fixed base uses, and we had to decide whether to buy another Apple for that purpose. Since we expect to also use a PC in our classrooms, we opted to put a Quadlink in one PC and not buy another Apple. We won't know how successful this is in the classroom until next fall, but all the good things we read about Quadlink are true. It's very easy to use, and it runs all the Apple stuff we have tried. We had heard it might have difficulty with copy-protected software, but Screenwriter and General Manager work fine on it. The only problem we have had is in reading GM data disks that were written on Apple drives. However, when these disks were copied with the Filer disk that comes with Quadlink onto disks written on the IBM drives (in Apple format, of course), the copies worked fine. And Filer had no trouble reading the originals accurately.

Now the undocumented feature. The QL manual lists control sequences for printing text that are identical to Grappler commands for the Apple (and probably the same as for a lot of other printer interfaces). There is no mention of printing graphics, but we were curious to see what would happen if we tried Apple programs that print graphics with our Grappler - NEC 8023 combination. They worked! Well, almost. The PC's have Epson FX-80 printers, and the Epson aspect ratio requires rotating hi-res pictures, whereas the NEC does better if they are not rotated. But the point is that Quadlink knows the Grappler-Epson graphics commands, even though the manual does not say so. BTW, that manual is really the only weak link in Quadlink. It's not too bad for what it does contain, but it has no index, so it's hard to use as a reference manual. Fortunately it's not needed often. It seems to be written for someone unfamiliar with both the PC and the Apple, but I can't imagine why such a person would buy a Quadlink.

Does anyone know if it is possible to get Lisp for the Apple III ? Since it
can emulate Apple II, that would also be possible. Any information about

possible suppliers/sources or even if it can be done would be welcome.
Answers by mail, please.

Rob Warnock says, in part:

> It also happens to be the case that IF the grammar is LL(1) or even
> reasonably close, a recursive-descent parser is:
>
> ...
>
> 4. Capable of acceptable error-handling (assuming you want to
>   detect errors, not "fix" them)

This is actually an understatement. Error-handling is much easier in
recursive-descent/LL(1) than in LALR systems like yacc. It is possible
to build an error-handling module which fits between the parser and the
scanner which does all the work. The parser has to be specific about
what it wants -- this just means a slightly unusual-looking "scanner"

interface for the parser -- but the parser then sees a syntactically-
correct program regardless of what the user feeds in. The key feature
of top-down parsing, for this and other purposes, is that the software
"knows what it wants": it has a fairly specific idea of what sort of
input it's expecting at a given instant, and can take intelligent action
if there is a mismatch. Bottom-up methods like yacc don't give you this
sort of detailed context to work in, which is why error repair is such
a headache for them.

The above is not theory; such an error-repair system was built here at
U of T years ago for the SP/k compiler, and several similar things for
other languages have been done since. It really works well.

>
> Sorry, didn't mean to come on so strong, there. IS there any good reason
> to use any top-down method?

Yes. The *only* thing bottom-up has going for it (aside from being more
"fashionable") is that one can build bottom-up parser generators that
accept a very wide range of grammars and make it very easy to throw a
parser together quickly. This is important, particularly when the parser

is secondary to some other objective, but it isn't everything.

Top-down schemes, in general, can do better error handling/repair (see my other followup for comments on this), are easier to fit semantics into, cope better with situations where odd parsing methods are needed for some special component of the language, and are easier to understand and work with. Their one problem is that it's often harder to cast a given language into a suitable form. Note that there are better ways of specifying top-down parsers than LL(1) grammars: LL(1) grammars are incredibly difficult to come up with, but tables for table-driven analogs to recursive descent are very easy to write. Even so, it's not quite as simple as throwing together a yacc grammar.

In short, top-down methods show up much better when the problem is to write a "production" compiler/whatever and one is willing to expend considerable effort on getting things just right. Bottom-up methods work much better -- **IF** you have yacc or the equivalent already written! -- for quick experimenting and throwing together a parser for a user interface to some other tool.

It is unfortunate that top-down parsing methods are badly neglected in current textbooks and courses.

In the "What's New?" section of the May BYTE I noticed a description of a Tektronix 4014 emulator for the Lisa. Since I have a Mac, I

gave the the people a call and asked if they were doing anything for
the Mac. The answer was a definite YES, and they are hoping to
ship product around July 1. The person I talked with said the emulation
was pretty complete, multiple character sizes e.g., though he mentioned
that dotted lines were too expensive to do at high speeds and were't
implemented. The price wasn't set, but expect $200-$300. For
more info contact:

There have been a number of requests on the net for real (native code) C and
Pascal compilers for the 6502, and a fairly noticeable lack of response.
As it happens, I've been studying the 6502 recently and I've reached a
conclusion that is now ready for beta-testing ("let's throw it onto the
net and watch them kick it apart"), to wit:

    There will never be any good C or Pascal compilers for the 6502.

Before you start organizing the mob of peasants with torches, allow me to
explain. C and Pascal, and other similar languages, make extensive use
of what C calls "automatic" variables. These are variables that are local
to a particular function and have no existence outside it. Space is
allocated for them when the function is entered and released again when

the function is terminated. This is essential for recursion and allows
better use of memory in general.

This causes a problem for the 6502 in that these variables do not
occupy fixed addresses: an address may be different for every call
to the function. The usual solution is to express these addresses
as offsets from an index register: when the function is called, all
you have to do is put the right base address in the register and
the code is ready to run.

Unfortunately, although the 6502 has two 8-bit index registers and a
zillion different ways for clever assembly language programmers to use
them, it doesn't have any 16-bit index registers. So the usual solution
doesn't work, unless you can live with a 256-byte address space.
Worse, there don't seem to be any other good solutions. I will briefly
consider a few possible solutions.

> Fake the automatic variables: use fixed addresses except in recursive
> functions. This requires the compiler to recognise recursive
> functions: easy in Pascal, not always possible in C (consider
> indirect recursion with separate compilation). This loses the
> memory saving of automatic variables and still has to deal
> with recursion somehow.
>
> Fake an index register: construct the address in memory, probably
> on page 0. This is very expensive both in time and instruction
> space. It requires a minimum of one extra instruction for every
> reference to an automatic variable (probably more).
>
> Calculate all the addresses once on entry to the function. This
> is an improvement over the previous scheme, but makes calling
> a function very expensive.
>
> The register approach: put all automatic variables in "registers"
> (fixed locations on page 0) and save all registers before entry
> to a function. This can be improved by keeping a pointer to the
> highest location with a meaningful value, so you don't waste time
> saving garbage. It also makes calling a function expensive,
> depending on the number of local variables it uses.

Note: very little of this applies to arrays, since you have to do address
calculation for them anyway. For the record, the 8080 or 8085 is even
worse off, since it doesn't have all the nifty addressing modes of the 6502.
The Z80 is a different story, since it has two 16-bit index registers.

Sorry this got so long. "There ain't no such animal" propositions are
hard to defend. I am very interested in hearing other people's opinions
on this, especially if someone can refute me. Does anyone know how
Manx C does it?

Manx C65 allocates automatics off the stack, as usual for C runtime
design. However, they do not use the hardware stack since it is too
limited but instead maintain their own (SP in a known place). This
works just fine, although clearly a better architecture would permit
faster, smaller code.

<----->

Several people have inquired about the "Fat Mac" article wondering if any

dates were quoted. There is no real indication other than late 84 or into 85. One wonders what the upgrade will cost - will we get soaked, or will it be fairly close to cost?

A question to other Mac owners.. I have heard that an updated MacWrite/ MacPaint is due out about now. Will owners of the old version get a free upgrade, or will it cost us $?

I don't know if there is anything built in to support the Dvorak keyboard, but I DO know of one third-party way to get it, and that is to buy Diversi-DOS, whose 64K incarnation allows the user free rein to create keyboard macros totalling 256 characters; one of the files included with Diversi-DOS is a complete remapping of the keyboard for Dvorak. This capability is also available for the Apple][and][+ if there is a language card present. I haven't got the address of the maker (Diversified Software Research, Inc.) handy, but there have been adverts in the magazines recently.

1. What does PR# mean? (only partly :-))
2. Scrolling and wraparound work just fine if you use interrupts.

Doing interesting things with peripherals and unable to remember seeing
my Apple in 40-column mode.

If any one is using a mouse with their Apple //e,
I would like to know what it can be used with
besides the Paint software.

Any other application information would be greatly
appreciated.

Any experience with sound boards for Apple ? Would
like to hear any comments. Thanks in advance.

There is a simple way to get your keyboard configured anyway you want.

All Apple II series machines handle character output in the following way:

There is a routine in ROM called COUT (CHaracter OUTput). Upon entry to this routine an ASCII value is expected in the A register (accumulator). The routine does a jump to a routine pointed to by locations $36 and $37.

If one changes the bytes at these locations to go to a user routine, it is simple to intercept the character to be printed and change it to something else. A simple way to do this is with the following program:

```
            TAX
            LDA TBL,X
            JMP $FDF0
```

That's it. The actual ASCII value is transferred to the X register and then used as an index to pull the character that you want to see printed in its place, then goes to a routine to print a character to the screen ($FDF0-called COUT1 I think).

An exchange can be done for all keys although problems crop up where the shift key is concerned for Apple II and Apple II+ machines.

If there is sufficient interest, I will be more than happy to implement the above program in a more user friendly environment.

My wife's elementary school needs a program to run on a IIe
with one or two drives. This program will be used to keep
track of the school's inventory of textbooks used in 5 grades
and kindergarten. All suggestions are welcome, but budgetary
considerations make public domain software particularly
attractive.

Please reply to me or the net.

Thanks,

Brint

To quote Feb '83 Byte on the //e.
"A ROM on the main board maps the keyboard-switch closures into the appropriate
ASCII codes and can be changed to provide foreign or special keyboards.
(Incidentally, the American version of the ROM is only half used. The other
half holds a Dvorak keyboard map that can be accessed with a few jumpers
and etch cuts.)"
By the way, does anyone know how get get rid of the n-key rollover bug in
the //e? (The bug is that certain combinations of keys introduced unhit
keys. Like "the" produces "thje".) Would the scan of the keyboard have
to be speeded up or what?

    I've been having trouble recently with my C compiler. If I can persuade the linker to work properly the code generated often will just run and then stop. Without ever having printed anything out. I'm running Aztec C65 1.05i, although I'm probably going to order an update soon. Has anyone else had this problem? Does anyone know if it is related to the following question?

    I have a Rana Elite I disk drive (along with a generic half-height drive). Rana provides software to take advantage of the fact that their drive runs considerably faster than most others (my disk speed program rates it at 43 on a scale of -100 to 100, where -5 to 5 is "acceptable"). Since several of the programs I use very often (Aztec C and the ORCA/M assembler) use their own modified versions of DOS, I have been wondering whether I should adjust the speed of the Rana to make it compatable with my other drive. Any ideas? If that seems acceptable, then where is the adjustment!? I took the drive apart, the strobe lines were all there and everything, but I could find no sign of any adjustment screw. Anyone?

    Is anyone out there using the ORCA/M assembler? I have it and am enjoying it, but I understand that there are quite a few bugs hidden around. The only ones I have found are trivial (except for the one that keeps reseting my CPS card to midnight, 2148 AD). Comments?

Rumor is that Apple (most Shugard drives in fact) are capable of
double density recording butr controllers are behind the times. As an
Apple, I would be very interested in drives with 630k/side. (80 tracks,
32 sector/track). Of course I don't expect Apple to tell me about this, so
does anyone out there know of a way (if any) to:
   1 Allow the apple/Quentin/etc. drives to use all 80 tracks
       (its claimed the existing drives can do this now)
   2 Allow the apple to use something called MFM recording

All info is most helpfull.   ..!noscvax!sdcsvax!sdccs6!ix255

Organization: Intel, Santa Clara, Ca.
Lines: 84
Xref: 1472 246 250

Is there any high-level language for a 6502 based machine that
executes the final code quickly and efficiently?

Recent discussions in net.micro.apple and net.micro.cbm seem to indicate:
- No very efficient compilers exist
- It is very difficult to write efficient compilers for the 6502

Most of the compilers for 6502 machines either:
- compile down to an intermediate code which is eventually interpreted
  (For example: Apple Pascal compiles to p-code)
- compile down to 8080/8085/Z80 code and require external hardware
  (For example: Turbo Pascal requires CP/M card)

Neither case is a true, fast 6502 compiler.

Jim Janney writes:

From: janney@unm-cvax.UUCP
Newsgroups: net.micro.apple,net.micro.cbm
Subject: compilers for the 6502
Message-ID: <850@unm-cvax.UUCP>

There have been a number of requests on the net for real (native code) C and
Pascal compilers for the 6502, and a fairly noticeable lack of response.
As it happens, I've been studying the 6502 recently and I've reached a
conclusion that is now ready for beta-testing ("let's throw it onto the
net and watch them kick it apart"), to wit:

    There will never be any good C or Pascal compilers for the 6502.

Before you start organizing the mob of peasants with torches, allow me to
explain. C and Pascal, and other similar languages, make extensive use
of what C calls "automatic" variables. These are variables that are local
to a particular function and have no existence outside it. Space is
allocated for them when the function is entered and released again when
the function is terminated. This is essential for recursion and allows
better use of memory in general.

This causes a problem for the 6502 in that these variables do not
occupy fixed addresses: an address may be different for every call
to the function. The usual solution is to express these addresses
as offsets from an index register: when the function is called, all

you have to do is put the right base address in the register and
the code is ready to run.

Unfortunately, although the 6502 has two 8-bit index registers and a
zillion different ways for clever assembly language programmers to use
them, it doesn't have any 16-bit index registers. So the usual solution
doesn't work, unless you can live with a 256-byte address space.
Worse, there don't seem to be any other good solutions.

...

Jim Janney
{{convex,ucbvax,gatech}!unmvax, {purdue,lbl-csam,cmcl2}!lanl-a}!unm-cvax!janney

One language that seems to be fairly efficient according to net response is
Manx Aztec C. They seem to have circumvented this problem as follows:

Doug Gwyn writes:

From: gwyn@brl-vgr.ARPA (Doug Gwyn)
Newsgroups: net.micro.apple,net.micro.cbm
Subject: Re: compilers for the 6502
Message-ID: <2124@brl-vgr.ARPA>

Manx C65 allocates automatics off the stack, as usual for C runtime
design. However, they do not use the hardware stack since it is too
limited but instead maintain their own (SP in a known place). This
works just fine, although clearly a better architecture would permit
faster, smaller code.

****

OK, so Aztec C is fairly efficient, are there any other efficient languages
for the 6502 (besides assembly)? Will there ever be?

{The views expressed are soley my own and not necessarily those of my employer}

>THE opinion:
>I have read the specs and I personally

>AM NOT IMPRESSED!!!

Well, I have read the specs, and I AM impressed. The only thing it doesn't have is lots of expandability, and I'll bet the disk drive port will give us that some day. I have decided to go ahead and purchase a IIc unless something bad shows up in it before I get to it. I wouldn't consider it if I needed CP/M, a clock or something else that requires a slot but because all I'm really interested in is already available in the back of the machine (printer, modem, mouse, monitor, second disk) I don't care. The minimized chip count should make the stupid thing very reliable, the light weight and small size will help it to fit into my house, the low price (compared to earlier apples -- I had a II+ that was pretty comparable to the IIc and it ran me a good $2800 versus <$1500 today) makes it competitive with things like Commodores even before you thow in available software (Wizardy again! *drool*) and customer support issues.

chuq
If it only had a decent processor. Not that the 6502 sucks or anything....

This has been said before but I guess it needs repeating now and then.

Do *NOT* post advertisements on net.micro! net.wanted was specifically
created for this. Net.micro and some others are particularly sensitive
since they also go out on the ARPAnet where it is against ARPA policy
to put any advertisements or solicitations. That means if it happens to
often the link will be cut and a valuable source of information will be
lost. So please do not cc your ad to any news group you think will be
interested, if they want to buy something they will read net.wanted.

              --Chuck

The upgrades of MacWrite/MacPaint and the Finder are available from your friendly Apple Computer Dealer. The upgrade is free to those who bring in their old "System Disk", and 2 "Write/Paint" disks. The dealer has a master copy and will do the copying in the store.

Some of the new features are:

New Application.. Disk Copy.. The maximum number of swaps to copy an entire disk has been reduced to four.

New Finder Command.. Set Startup.. you can set up a disk to load and run an application when it is booted, skipping over the Finder.

New Fonts.. A 10-point font size has been added for Geneva and New York fonts. Cairo-18, Los Angeles-12, Los Angeles-24 and New York-36 are new fonts.

MacWrite.. has Superscripts and Subscripts.. yehhh

Make sure you do a (apple)
|
About the Finder..

well.. I won't spoil it

Also, I saw pre-releases of MacTerminal, MacPascal, MacDraw, and MacProject. Will these be out in June?? I hope!!

<>
I received a product announcement from Stellation Two for a coprocessor
board for the Apple II/IIe using a MC68008 (8-bit data bus version of 68K).
Stellation Two also makes a 6809 coprocessor board, which I have used
quite a bit and am very happy with.

The 68008 board, together with 68K FigForth, is advertised at $169 (!);
$229 with a 6502-to-68000 cross assembler.

This seems like a really cheap way to get your hands on a 68K system,
but it is unclear how useful it would be. The board uses the Apple's
memory and clock so it would not be a real dramatic increase in performance
over the 6502. However, it might be fun to fiddle around with while
waiting for your Mac.

You say you want a development system for the Macintosh, but assembler ain't your style, you don't want to wait 'til 1Q85 for standalone C or Pascal, and MS Basic is such a pig you can't stand it?

Your problems may be behind you: I recently picked up MacFORTH from Creative Solutions, 4801 Randolph Rd., Rockville MD 20852; or get out your VISA or MasterCard and call them at (301) 984-0262.

FORTH is a postfix-polish language; the compiler doesn't do a WHOLE lot beyond lexical analysis; the result is then interpreted by a lightning-fast stack machine emulator. Look for "Starting FORTH" for more language info.

What I got for $150 was MacFORTH level 1; level 2 is due out this month, level 3 next month. Withing a week of ordering I upgraded my license to level 2 -- this is a NICE package. Many of the toolbox goodies are directly accessible in level 1 (including full window and menu control).

Package includes a ~250 page manual, including tutorials that walk you through window and menu creation and management; a batch of demos reminiscent of the early jerq/blit demos (at comparable speed!); an online "getting started" tutorial; and an editor which harnesses the toolbox editor for writing FORTH code. No in-line assembler, but that is due in level 2. (Price $250, or upgrade your level 1 license for the $100 difference). Dealers will have the package soon; in the meantime, they will take VISA or MasterCard orders over the phone and ship UPS the same day (I and a friend each received our orders within 48 hours).

The disk is not copy-protected, but the license says "single CPU." Keep your larceny at bay on this one: these folks have done a NICE job and deserve the bread!

Incidentally, the editor is written in FORTH and can be dumped off to your printer. The source bears a caveat that they use the toolbox "text edit buffer" and scrollbar facilities, but that you use at your own risk; these facilities are not well-documented, but you can dope out a lot by reading the editor code, and they seem to work just fine.

I'd still prefer to have a high-level language, preferably C, but once you get adjusted (or readjusted) to thinking in postfix, FORTH is a convenient medium.

MacFORTH is fast, cheap, versatile, lets you get at the toolbox, and available now. DO IT!

From: "Jeffrey J. Josephson" (MISD-MAD) <jeffj@ARDC.ARPA>

Has anyone ever used the Hayes Smartmodem 1200 ? I tried
to but couldn't get it to work. I connected the RS232c cable from
the modem to the Dispatcher, which was placed into slot number 2.
I had pin 4 of the Dispatcher up because the mainframe to which I
will be connected to is 1200 baud. I then turned to page 2-9 of
the Hayes "Smartmodem 1200 Hardware Reference Manual", and tried
the initial checkout. The response should be "ok", but I got
"syntax error". Even though I got this message, I was able to
dial out and hear a computer tone, but unable to received any
prompts from the mainframe. The mainframe is for half duplex.
To dial out I used "AT Ds" and to call the modem typed "PR#2".

Any solution on how to access a computer with this particular modem
and Apple IIe computer will be most helpful.

Send mail to either info-apple@brl-tgr or send it directly to me
using jeffj@ardc.

In reference to the Aztec C part of your message:

Aztec's linker (unless they fixed it) has a very annoying bug. It does not know when it has run out of disk space. (Or at least it doesn't say anything about it.) So, it is very possible to get an incomplete compilation. I've had perfectly good programs start up and then seem to die simply because some piece of code that was called did not really exist due to a bad link. Maybe that is your problem. Remember that several large, intermediate files are created during the entire process. Try using a different disk drive for some of your temporary files.

Here is my situation.

I have some 512 x 512 bitmaps which I would like to edit with MacPaint.
The bitmaps are on a VAX. I am using MacTEP 1.8 to talk to the VAX.
It should be possible to download (encoded) 256 x 256 bitmaps to a basic
program which would then graph them. The resulting graph can be
snap-shotted into a macpaint file.
(note: basic => microsoft basic throughout this article)

Is it possible to:

1) Create a Macpaint document file directly from a basic program?
   (This would allow the full 512^2 bitmap to be placed in the file.)

2) Read a Macpaint file from a basic program? (Would like to upload
the bitmaps back to the VAX after editing.)

3) Cut a piece of a Macpaint document that is larger than the
Macpaint window? (I want to use the bitmaps in MacWrite.)
Also, If I could cut and paste bigger than the window, I could
get the 512^2 picture in by doing two 256x512 segments in BASIC,
snap-shotting each, cutting one and pasting it into the other.
(Assuming it could be aligned exactly).

It seems (in Macworld) that people ARE using digitizers to create
MacPaint documents. Would appreciate any ideas on how to accomplish
the above, or suggestions for better ways to do this.

The way I understand it the Apple][analog board does use the
MFM recording scheme. Also as Dave Seaman reported, the problem is in
the Tandem drive itself. It can half-track so as to give an appearance
of 80 track drives, but, as I understand it, there are two reasons why
this can't be utilitized to double the amount of info stored on a disk.
First, the width of the track written to disk by the magnetic head is
too wide to allow adjacent half tracks to be written without overlap, and
secondly, even if the magnetic head could produce a sufficiently "thin"
recording track, the head positioning mechanism is not precise enough to
take advantage of it. Some computer manufacturers such as Commodore get
around this by writing more than 16 sectors to disk on the outer tracks,

but this leads to an anoumously high diskette failure rate...

I suggest you check out the Action! language available from OSS (Optimized
Software Systems, I think). It was originally written for the Atari 800
(6502) but versions were supposed to become available for the Apple, etc.

It compiles into very fast code, is prodecure-oriented, supports 16-bit
(CARDinal or INTeger) variables as well as 8-bit BYTEs, supports pointers,
arrays, standard I/O package, etc. The only major limitation I have found
is that you can't nest function calls: Call1 (Call2 (X)). And you can'T
recurse. But it sure beats anything else I've seen....

There are at least two different "apple drives". The old original is a standard Shugart 390 mechanism, with Apple data handling electronics. I believe that the current drives are sourced in the orient, but have no details.

If you have a Shugart drive, you should be able to purchase a service manual directly from Shugart, 475 Oakmead Parkway, Sunnyvale Ca 94086 (408)988-2800. If they don't have a 390 manual, you could also use the manual for a 400, since the mechanism is identical (the 400 has data electronics and a few extra goodies like an index sensor and head lifting solenoid).

First, however, do a few checks:

(1) format a blank disk, write something, and try to read it. If you cannot read it, your problem is NOT alignment (or at least that's not the only problem). You should be able to read your own recently written disks even with badly misaligned heads. if the newly formatted disks read ok and the old ones (or disks written by others) don't work, you can suspect alignment. You need a special disk and an oscilloscope to do alignment the official way, so the manual by itself won't help you much. It shouldn't cost much to get a local service shop to align it for you.

(2) Check that the head is clean. You don't need a manual for this. Remove the cover and large electronics board (be careful with the small connector to the head cable - it's fragile). Lift the hinged pressure pad out of the way, and examine the head. If it looks clean and shiny, leave it alone. If it has visible accumulations of crud, scrub it clean with a Q-Tip and pure isopropyl alcohol. Don't use "rubbing alcohol", vodka, etc. The head cleaning solution sold for cassette tape decks is ok (Radio Shack, etc). Also look at the felt pressure pad. Standard advice is to replace it with a new one. I just lightly scrape the pile surface with a knife edge, which dislodges the accumulated oxide, and I'm still using my original five-year-old pads. The manual claims that after replacing the pad, you should rotate it a few degrees at a time while monitoring read signal strength with an oscilloscope, leaving it in the position that maximizes the read output voltage. Before I noticed that instruction, I had removed and replaced my pads several times without paying any attention to orientation. Since I have never noticed any read errors, I haven't bothered to check the signal strength

and make the ajustment. Maybe I'm lucky, or more likely, the Apple read electronics has a wide latitude and Shugart is being over-conservative.

(3) Check the disk speed. Some utility disks (such as recent versions of LockSmith) include a program to measure and display speed. Alternatively, there is a built-in strobe disk on the motor (at least there is on mine). You simply look at it in flourescent light and adjust until the pattern is stationary with a disk inserted and the head on a center track (a "catalog" command should get the head on the center track). The adjustment screw is on the little motor control board at the back of the drive. It's a typical long skinny 10-turn pot, and is the only ajustment on that board. Speed can be fairly far off before problems occur.

(4) Check the cable and connectors between controller and drive. You could have a broken wire - the exposed cable takes a beating whenever you move things around.

(5) If all the above doesn't fix it, your problem is probably in the Apple electronics, and The Shugart manual won't help. First borrow a good controller board, to isolate the problem to either the controller or the drive (or just interchange drives, if you have two). I have never seen any detailed description of the Apple controller and drive electronics. There is a schematic in the back of the DOS 3.2 manual (and probably the 3.3 manual, although I don't have one handy to check). The book "Beneath Apple DOS" explains in a general way what is going on in the digital stuff, but pays no attention to circuit details. If you want to work blind, first check the ROMS on the controller - they seem to be more fragile than the other chips.

A while back there was some talk about the problem of restricting Mac
resales. It was suggested that only a leasing arrangement would legally
inhibit resale of college-bought Macs.

Well, Harvard is now releasing Macs by a system of one-year leases (the
price is ~$1200), after which period the machine does indeed become the
full property of the lessee.

Some brief MACnotes from the faire -

o Reportedly, next months BYTE magazine wil have one of those 'do it yourself' articles by Steve CIARCIA on how to upgrade your Macintosh to 512K.

o Creative Solutions was there with there MacForth. It was very impressive, although I don't speak FORTH yet. It is the same 68K FORTH kernel they have supported for 3 years or so on other 68K machines, and appears to have been well ported to the Mac. The speed was impressive. The difference between the level I forth and the level II is that for an extra $100, level II provides an assembler and extended graphics routines. The author said he has been working 20 hour days for the last 3 months getting this product ready. They also offer a 25% educational discount.

o Saw a couple of graphic adventure games - each was interesting. One from PENGUIN is expected out in less than a month.

o Got a good look at MACproject. Was VERY impressed. Seems to do everything you would want a structured graphics program to do. Will be out in the summer. Entering beta test now.

o If you bought Multiplan, be sure to send in your registration card. Microsoft is currently sending out a free update to correct some bugs.

Subject: floating point

Mac uses a floating point emulation package which essentially implements full IEEE numerics. It is another implementation of SANE (Standard Apple Numerical Environment) which exists for the Apple III and now the II with Pascal and I suppose LISA as well. The package takes up something like 6K but I don't know about speed. I know our SUNs run floating emulation which is pretty lousy, but Apple has been doing SANE for over 2 years now so they have probably learned some tricks. Still it IS software.

Subject: MacStuff

I am going to try to clear up all that has gone on while I was on spring break:

Apple Pricing : Inside Mac - no comment.
Apple Dealers can get a Macintosh, Imagewriter, MacPaint/Write, Multiplan, and a carrying case all for $1068. The reason the Mac is priced at $2500 is to protect the II/e sales. Prices are expected to come down when Mac Sales slack off.

Colons : The colon is used to separate volume and file name. This is mentioned in the Multiplan manual. As a matter of fact, if you try to edit a file name and put a colon in, it gets translated to a space.

Stretching : The shift key forces proportion, i.e. horizontal, vertical, and diagonal lines, true circles, and movement along one axis. When stretching, where you put the cursor is what counts. Near the middle of a side of the box will

cause one dimensional stretching, near the corners will
provide to dimensions.

Subject: 1/2-meg Lisa

I'm trying to low-ball a Lisa-2 (i.e., get the cheapest model I can) to meet my word-processing needs, with an eye to future use for software development. But I'm having trouble with hardware/software configurations. There seems to be almost no flexibility in the operating system(s) available for the Lisa and Mac.

The basic, stripped-down Lisa-2 comes with "only" 1/2 megabyte of memory. What software can run on this, and under which OS? I hear the Lisa Office System (LisaWrite, LisaDraw, etc.), which "runs under the Lisa OS" (?) won't run with less than a meg. I also hear all Macintosh programs will run on the 1/2-meg Lisa, "under the Macintosh OS" (?). But does this mean the Mac program won't know about the hard disk or the letter-quality printer on my Lisa?

Lists I've seen of 3rd-party software show them as being tied to

either the "Mac OS" or the "Lisa OS"; none on the list I saw
(with about 200 entries) ran on both OSs. This seems strange to
me; given the traditional style of interface between an application
program and the OS, the differences between the Mac OS and the Lisa
OS should be (mostly) transparent to the application program:
   o multi-tasking - A stand-alone program such as a word processor
       shouldn't have any direct need for multi-tasking services.
   o size of memory - Memory-management service calls to the OS
       shouldn't depend on the amount of memory installed in the
       box.
   o size of video bit-map - The way I understand Quikdraw to work,
       the application program should just have a "picture space"
       (or some such term) to work with, and shouldn't care how
       Quikdraw chooses to display this space on the screen.
   o different peripherals - Hasn't Apple yet heard about
       "device independence" for their I/O systems? Seems like
       an application program, such as a word processor, shouldn't
       care if it's sending the text to an Imagewriter or a
       letter-quality printer; the OS should mask the differences
       in the device interfaces. I hear even CP/M supports some
       level of device independence.

Of course, these are traditional notions of what an OS does for you.
Lisa/Mac represent quite a few departures from the traditional notions
of what a computer is. But I sure would hope the Lisa/Mac OS's
would support some kind of decoupling of the application program
from specific hardware configurations.

Any information about the software-OS match-ups supported would
be appreciated.

Also, I hear Apple has conveniently modified the EPROMs on the
Apple (nee Qume) letter-quality printer, so you can't just
plug in an off-the-shelf Qume printer instead of the Apple
printer. Well that's fine for Apple-developed software --
does anybody know if the 3rd-party word processing packages
will support the more common letter-quality printers
(e.g., Brother, Qume, Diablo, NEC, etc)? A cheaper letter-quality
printer would sure help my "billfold blues"!
(Again, is the support for the different printer protocols in
the OS or the application program?!?!)

I am not sure what "letter quality" is, but we found that printing

on the Apple Imagewriter and reducing it down to 90% on a Xerox
machine produces very good looking output. This was after turning on
the high quality option when print was selected on the Mac.
My only gripe about the printing is when in "high quality" mode, those
high quality line feeds at the end of a document are VERY slow.

----
books on Macintosh at the Ninth West Coast Computer Faire

One indication of the success potential of a product is the number of
authors who think they can make a buck writing a book about that
product. There were at least four books on Macintosh already on sale
(with announcements of more to come) at the Ninth West Coast Computer
Faire. Although most of the books seem to be "quickies" that merely
reiterate the standard documentation that comes with a Macintosh, some
seem actually worth buying.

Microsoft Press   (distributed by Simon and Schuster)
     "The Apple Macintosh Book"   <for sale>
          Cary Lu $18.95   320pp.
     "Presentation Graphics on the Apple Macintosh"   <announced>
          Steve Lambert $18.95   256pp.   <May84>
     "Macwork/Macplay"   <announced>
          Lon Poole $18.95   352pp.   <Aug84>
     <book on Microsoft Basic for the Apple Macintosh> <rumor>
          Mitchell Waite
     <another book on basic>   <rumor>
          Mitchell Waite
     <book on Microsoft Word for the Apple Macintosh>   <rumor>
          Mitchell Waite
     <book on Microsoft Multiplan for the Apple Macintosh>
     <rumor>
          Mitchell Waite

Softalk Books
     "Macintosh! Complete"   <for sale>
          Doug Clapp $19.95   ~240pp.

Hayden Books
     "Macintosh Revealed"   <announced>
     "Macintosh Instant Pascal"   <announced>
     "Macbasic Tutor - Volume One"   <announced>
     "Macbasic Tutor - Volume Two"   <announced>
     "Macbasic Programmer's Reference"   <announced>

Reston Computer Group   (a Prentice-Hall Company)
     "Understanding the Macintosh Computer"   <announced>
          Rick Dayton

Sams Books
     "Introducing the Apple Macintosh"   #22361   <for sale>
          Connolly/Lieberman $12.95   ~120pp.
     "Insight to the Apple Macintosh" #22319   <announced>
          ?? $12.95   288pp.

Dilithium Press
     "Presenting the Macintosh"   <for sale>
          Miller/Myers $5.95   116pp.

We are informed that the Cary Lu Mac Book was heavily subsidized
by people with big financial stake in high Mac sales, so that
one, at least, can hardly be counted as independent evidence of
future Macsales. There were big Maccrowds around the Macintosh,
though, and we are Mactold that the Macintosh is out macselling
the PCjr.
     At Faire I saw almost not macsoftware. There was
macforth, and bruce tonkin had a nice program demonstrated at
the Workman booth, but outside ot macplan (which has a ghastly
form of maccopy macprotection) I saw maclittle outside software.
Did I macmiss macsomething?

If thaty macraise that price any more, by charging for their
macsoftware for a mac chine that doesn't do bery much anyway,
they'll probably be in mactrouble. I understand the Wall Street
journal is preparing a macevaluation that is not macfavorable
for it as a macbusiness machine. Of course that's correct; it
takes about 40 disk swaps to make a backup, and no business can
operate without safety copies. Even the macforth people had no
second drive (well they had one, but it was a kludge without case.)

To: CAULKINS@USC-ECL.ARPA
cc: info-mac@SUMEX-AIM.ARPA
In-Reply-To: Message from "CAULKINS@USC-ECL.ARPA" of Tue 27 Mar 84 07:35:37-PST

The Finder now has a 50K buffer, worst case, which means that a 400K disk should be copyable in 8 swaps (16 insertions), + a swap to get back the boot disk.

There will also be a single-drive-copy utility which will use a 100K buffer (including the screen) which allows a disk copy in 4 swaps (8 insertions). For copying a small number of files, the Finder will be better, however. For example, copying four 10K files can be done in as little as one disk insertion.

JEP's note about Mac not being a good business machine will be obsoleted by the external disk drive. Since I'm at Apple, I've had a Mac and an external drive for quite a while now, and backing up is trivial. Why all the negative stuff, JEP? Still living in the S100 world? Please go and try one--I think you'll be pleasantly surprised, if you approach it with an open mind.

Bruce

I usually try to avoid public ad hominem remarks, but does everybody else find JEP as obnoxious as I do? Honestly, Jerry, we heard all the Mac prefix jokes we're likely to need already. Please try and use the real English language from here on out. Just because advertising people don't use it is no excuse for us not to.

Macintosh stuff at the Ninth West Coast Computer Faire

In addition to books on Macintosh for sale at the Ninth West Coast Computer Faire, several other Macintosh and Lisa related products were on display. It seems reasonable to assume that many Lisa related products will be converted to work with Macintosh.

Hardware

Tecmar demonstrated both a ten Mbyte fixed winchester disk system and a dual five Mbyte removable winchester disk system (the obvious fixed/removable combination is also in development). Each system was connected to Macintosh via one of the serial ports. Both are expected to be available by fall and cost slightly over $2K. They announced print buffer and an HPIB-to-AppleBus converter products, but no firm information.

Several Apple Macintosh external disk drive preproduction prototype drives were seen, but none were for being sold.

Several manufacturers (Apple, TNW, Hayes, etc.) demonstrated 300 and/or 1200 baud modem products with MacTerminal.

The Artsci demonstrated their MacPhone product (touchtone, two phone lines, auto dialing, hold button, rate timer, etc.). They said it was completed and awaiting FCC approval.

Software

Several retail/wholesalers were selling Microsoft's MacBasic and Macintosh Multiplan. Several developers demonstrated programs using Instant Pascal (looks fairly fast although the windows may actually make it harder to use). MacProject (very impressive) and MacTerminal were show by various vendors.

Creative Solutions was selling MacForth (level one for $149 and level two for $249). It looks good as a product, but the cost of right-to-execute license may limit potential markets.

A version of Creator/Reporter for the Macintosh was demonstrated at the Workman & Associates booth. Creator is a public domain data base program generator for Microsoft Basic while Reporter is a report program generator.

Penguin Software demonstrated a version of Transylvannia for the Macintosh (Apr84 $34.95). They announced that Graphics

Magician Picture Painter, The Quest, and The Coveted Mirror would be released by summer.

Sir-Tech demonstrated a version of Wizardry for the Macintosh (available soon) and mentioned that several other games which they may convert.

> Parenthetically, most of the interesting animation affects on the Apple II were accomplished via page-flipping between the high resolution screens. Is there any way to change the start of the displayed memory in Macintosh? Is this technique necessary in Macintosh for animation effects?

Artsci mentioned that they will probably convert their Magic Office System to run on Macintosh.

Videx demonstrated their Desktop Calendar (notebook, appointment book, alert, tickle file, calendar, etc.) for the Lisa 2 Office System. One of their people indicated a Macintosh version was in development.

Macintosh Development Team

The following booths had Macintosh Development Team posters indicating that they have a least some level of interest in developing Macintosh related products:

Apple	Sir-Tech
Creative Solutions	Penguin Software
Hayden Books	International Apple Core
Dilithium Press	Call-Apple
Waveform	Softalk
FTL	Pterodactyl
Artsci	TNW
Central Point	MacWorld

The thing about Pournelle, whose remarks in general, it seems to me, sometimes reflect lack of information (it`s called being both positive and wrong), is that on the Mac he has, it seems to me, turned nasty. It is my opinion that many of his remarks seem to reflect a lot of anger. Why he should be angry, and at whom isn't clear. As long as he confines it to this bulletin board, each of us can filter what he says through our own opinions. When he starts to put some of the content in his column, he can be damaging. I believe there's something going on; I live near him and offered to let him look at my copy of 'Inside Macintosh' and answer any technical questions(I am an Apple registered developer), giving him my phone number and offering to make myself available at his convenience. He never took me up on the offer, and is still spouting what I see as emotional anti-mac stuff. I dunno, Marty, what do you want to do tonight? --david--

ye flinking gods.
LOVE ME, I am APPLE, and you MUST LOVE ME! Anything less than total devotion shall be punished.

Tell me, MacSir: if I am a business man and I put together a large and important financial model, how shall I save it? How back it up? How many swaps? And if I wish to DO SOMETHING USEFUL, with what do I macDo It?

I am getting damned tired of the MacHype, and especially the kind of crap represented by your comments about my "emotionalism". Anything less than total devotion to the Mac is, I gather, punishable. One does not question the Good Guys.

Well, we have bought a Mac for 3000 bucks, and the documents that explain the error codes and such like for another 150; which is why I had no need to take you up on your macoffer, and besides, I didn't need another dose of machype about how macwonderful it is.

I have yet to get a logical answer to the question of what the computer for the rest of us can DO just now. True: if they can sell enough of them, then the software may appear (assuming the deliberate limits to the machine such as the soldered in 128 k of memory and the single drive and the keyboard with no escape key and no arrow keys and the non-available numeric keypad (not available at our store anyway,

and unimportant; I presume it will come) -- assuming the inherent limits don't stop the software, then if they sell enough of htem it will get written.

A neat job. Like a Hollywood movie. Go to the star and say you have the script; to the director and say you have a star; to the writer and say you have a director; to the money people and say you have star, script, and director; and with luck you will have made it all retroactively true. If you do not bring it off, well...

So Apple treats its customers as venture capitalists, and that's all right; but then they will not listen to any suggestions (you cannot imagine how many PLEADED with them to add another drive, or at least have the extra drive avaialable when it came out) and to keep the price at something reasonable is not within their intent.

Are those facts? Then if it were not an apple product -- if it were IBM -- would you condemn anyone for wondering what all the shouting is about?

Ye immortal gods. Do you wash your own brains, or do you take them to a laundry?

1> the Development Team Seminar was useless. More information has been in BYTE than Apple gave at the seminar.

2> Bruce Tonkin wrote the Creator program in his P-basic (which is a preprocessor to microsoft basic). It was about the only application software for Mac I saw other than the two microsoft (multi plan and basic) products.

I had not known Bruce put Creator in public domain. I believe my copy carries a copyright notice. It's not here just now so I can't check.

3> there is a problem with using the data base: namely that saves are slow and backup copies are slow to make. But it does work, and it's fairly impressive.

I wish people would follow the editor's advice and keep ``Is the MacIntosh a useful/bogus machine'' discussions off of INFO-MAC. They are a bit like the anti-UNIX flames that occasionally erupt in UNIX-WIZARDS, and generates no more useful information.

As for Jerry Pournelle, I would hope that someone who has been around as long as he has would have a bit more respect for the purpose of this list: information, not innuendo. The jury is still out as to what kind of technological advance the Mac represents (if any). Right now, those of us with Macs and those of us preparing for Macs want hard data, to see just what we can get this beastie to do. Six months from now we'll all know just how successful our efforts have been.

If you want to argue the relative merits of the MacIntosh as compared to the IBM-PC or the IMSAI 8800, do it in INFO-MICRO where such discussions are more appropriate. Or even better, bite your tongue for a while until the dust clears.

When (Real Soon Now) you can GET the external drive (and how much will that cost?) I will be glad to act as if Apple is selling a two-drive systm. At the moment, for completely

unfathomable resons--certainly no one has ever given me a logical explanation other than that by saving some money Apple can pass the savings along to their stockholders, just like IBM does-- the Macintosh is a single drive system.

When the software is out, and the second drive is out, and the extra memory is installed, you are probably talking about a $4000 package. It may be that for that price there is no competitive system, but I thnk I do not _a priori_ accept that.

If the systems documents came with it, one might be able to decide what you could REALLY do with the Mac; but in fact the "development seminar" at the Faire was a , well, I won't say joke, but the kindest words I heard were "waste of my time" (this from a Mac enthusiast). Thus: I don't know whqt you can do with a Mac other than buy a Lisa-2 to keep it company. Lord knows this is a clever deal for Apple; Lisa sales were not very good, so perhaps the Mac can do something to remedy the situation.

None of this is reprehensible. However, I see no reason to pretend that Apple has joined the ranks of the public benefactors, or that we should view this marketing strategy any differently from the way we would view it if IBM or DEC had adopted it.

If IBM had come out with a proprietary operating system, every editor in this field would be screaming at them.

The MacIntosh divides the micro community; there is not even a way to get source code onto it (except through a Lisa). The documents that come with it do not explain the error messages you can get by what seem reasonable operations. Thgere are several ways inadvertantly to lose text or pictures (we lost the pretty picture of the fish when I cut instead of pasted).

I can do four to six page illustrated memos with a Mac. Or with a Flair.

The worst is that there exists a terrific operating system, more or less derived from the dame place that Apple got the ideas for Lisa and Mac. It's the PUBLIC DOMAIN Modula-2 operating system that uses mouse, has integral debugger and real time windows, and does provide a programmer's dream working environment; not only does Macintosh not seem to have made any attempt to interface with that, but I have some evidence that there's not enough information given to allow that to be done.

I want to see the MAC dragged, kicking and screaaming if need be, into the micro world so that it can be source code compatible with text filters, formatters, index systems, editors, and other stuff; why must we always reinvent the wheel? But I see little chance of that.

And the name of that game is MacProfit.

When IBM brings out a proprietary operating system, and isolates their customers from the rest of the micro world. will Apple cheer? (Probably; it also gives Apple a safe niche?)

I know that every time we are divided, we give another rachet to IBM. Theeffect of the Mac may well be to do that

again. WHY COULDN"T IT HAVE MADE SOME PRIVISION FOR SOME
COMMUNICATIONS WITH THE REST OF THE MICRO WORLD? WHY COULDN"T
IT HAVE HAD A , if not standard, then at least not DELIBERATELY
UNSTANDARD keyboard? And so forth. And why must I regard all
these trends as if they were handed down from on high, so that
it is the Sin Against the Holy Spirit to question them?

Jerry,

We don't want you to become mindless, just reasonable. Everything Apple
has done, for which you are willing to specifically indict them, is
similar to what I've seen on EVERY new machine to come out, unless it
was just a rehash of some older, similar machine.

Sure, you'll get lots of available software if you buy a Kaypro-10, or an IBM PC clone. This is a good reason to buy such a machine. However, this mentality would eventually mean that we'll be using PC clones well past the year 3000!

Macintosh is a NEW machine. This may be the reason why no one wants to hear about its lack of software AT PRESENT. No radically new machine has ever appeared loaded with tons and tons of debugged, excellent software. Why do you insist so vociferously that Macintosh must, or be tossed out the door as useless? This thinking seems deliberately designed to prevent the machine from getting a fair start. Why?

Further, why do you insist that Macintosh be compatible with kluge ideas like arrow keys and Escape keys? This sort of demand mandates that every new machine be compatible with every old interface method that was ever invented. Why not complain about how the IBM PC won't punch and read Hollerith cards and paper tape? Think of all that old batch software you cant use because your home computer doesn't support HASP and JCL! Toss it out, it's useless to everyone.

If Macintosh were designed solely to be a terminal for EMACS, your complaints about keys would have merit. Since it's designed to have its own word processors, though, who cares if there is no arrow key, escape key, or meta key? Not me, nor anyone not intimately associated with using EMACS on his mainframe.

These sorts of ideas, when examined in the cold light of reason, are what are irritating to some of us. Why is it so difficult for you to avoid sweeping statements regarding the usefulness of the machine? Why not use this Bulletin Board as a medium for exchange of facts and suggestions, rather than a podium for opinions which many of the rest of us don't want to be bothered with?

Kurt

P.S.:

"ye flinking gods.
LOVE ME, I am APPLE, and you MUST LOVE ME! Anything less than
total devotion shall be punished"

"   I am getting damned tired of the MacHype, and especially
the kind of crap represented by your comments about my
"emotionalism". Anything less than total devotion to the Mac
is, I gather, punishable. One does not question the Good Guys."

This isn't emotionalism? What is that, reasoned argument and discussion?

K.

P.P.S.:

By the way, I take mine to the laundry. Cleanliness is next to
open-mindedness!

K.

Subject: Re: Jerry E. Pournelle
To: POURNE@MIT-MC.ARPA
cc: info-mac@SUMEX-AIM.ARPA, mike@RICE.ARPA, STERNLIGHT@USC-ECL.ARPA
In-Reply-To: Message from "Jerry E. Pournelle <POURNE @ MIT-MC>" of Wed 28 Mar 84 00:17:00-PST
ReSent-date: Wed 28 Mar 84 15:24:30-PST

Apologies in advance for the length of this but Pournelle has escalated
the level of heat in the conversation about the Mac, together with several
offensive personal charges and numerous factual errors, all in the public
domain rather than by private message. The following is a detailed
treatment of his last two messages. I suggest that those who would be
offended, bored, annoyed or otherwise made unhappy or uncomfortable hit
control-o or control-c (or whatever) now. I hope we can 'get off it'
quickly.

1. "ye flinking gods.
LOVE ME, I am APPLE, and you MUST LOVE ME! Anything less than
total devotion shall be punished."

> It seems to me, Jerry, that you made that up. I never suggested
> that attitude towards Apple; in fact I have a number of problems
> of my own with them, but not the ones you complain of.

2. "Tell me, MacSir: if I am a business man and I put
together a large and important financial model, how shall I save
it? How back it up? How many swaps?

> You save it with an outrider disk if you don't like swaps. They
> are shipping NOW. But they add weight to the mac and take up
> space, so those who don't want them can save that, and money, too.
> The author of the Finder is revising it to swap with 100k buffers.
> That will make it copy with far fewer swaps. The size of the disk
> and its rigidity make swaps physically fast and easy.

3. "And if I wish to DO SOMETHING USEFUL, with what do I macDo It?

> You buy software as it becomes available, just like everyone else.

When most machines are new, very little software is available. Lots is coming. Of course you don't buy a Mac for a specific purpose until the software is available. Nobody suggested you do.

4. "I am getting damned tired of the MacHype, and especially the kind of crap represented by your comments about my "emotionalism". Anything less than total devotion to the Mac is, I gather, punishable. One does not question the Good Guys.

This paragraph, and paragraph 1 above convicts you out of your own mouth of emotionalism, if any further proof were needed. Some of us are getting tired of your temper tantrums on a professional medium (info-mac). This isn't a high-school hackers' bulletin board.

5. "Well, we have bought a Mac for 3000 bucks, and the documents that explain the error codes and such like for another 150; which is why I had no need to take you up on your macoffer, and besides, I didn't need another dose of machype about how macwonderful it is.

Since I made my offer to share information and experience with you in sober professional terms, and since you know from our previous conversations that I am a 51-year-old Ph.D. with an M.I.T. computer science background, another tantrum is non-responsive to my offer. For $150 you got detailed explanations of the operating system, how to program and use the internal ROM routines and a lot more than just the 'error codes and such-like', in 3 thick 3-ring binders. How about dealing from the top of the deck in your remarks?

6. "I have yet to get a logical answer to the question of what the computer for the rest of us can DO just now.

Right now it can do Multiplan spreadsheets fairly well, and with a better user interface than any previous version of Multiplan, which is considered by many of us to be one of the two or three best spreadsheet/financial modeling programs around. I don't need to remind you that it was a primitive ancestor of Multiplan called Visicalc that sold thousands of micro-computers in business applications. It can be programmed, for those who wish, in BASIC. Before you dismiss that as derisory, there is already one public domain program, MacTep, which does excellent remote terminal access to micros and mainframes, and operates at pretty high speeds despite its being in an interpreted form of Basic. It can do a very nice job of short (1-6 page) memos and letters. It can allow one to draw useful sketches and charts. It is just getting started; smart college students who are on budgets and in many cases are computer science majors who know, better than you or I, what they are doing are beating down the doors to get the machine. Of course they are getting a promotional price, but their financial resources are also far less than most of us who work for a living. As a professional economist I would have to say that their utility curves (taking

account of their income) at the discounted price are roughly comparable to ours at full price. In other words, they pay less, but they have much less money to spend and so it's a wash.

7. "True: if they can sell enough of them, then the software may appear (assuming the deliberate limits to the machine such as the soldered in 128 k of memory and the single drive and the keyboard with no escape key and no arrow keys and the non-available numeric keypad (not available at our store anyway, and unimportant; I presume it will come) -- assuming the inherent limits don't stop the software, then if they sell enough of them it will get written.

The software is already beginning to appear and a lot is being written right now. Very few serious and substantial software developers are waiting to see 'if they can sell enough of them.' The soldered-in memory is for reliability. Apple conducted tests that convinced them that was in the interests of the users. Too bad if a few hobbyists can't plug chips in and out. Most of us prefer the reliability and Apple's stated plans are for a board swap at a very good price when more memory is available reasonably from at least two sources. Very professional. This isn't a tinkertoy for hobbyists but a serious machine. I don't know about you, but I and most professional knowledge workers also buy annual service contracts and bring our machines into our dealers for repair. We have neither the time nor the inclination to play with our professional tools internals any more than we would fix our own TV set power supplies.

The keyboard is definable in software. In MacTerminal, there is an escape key. It's Microsoft who messed up by not defining one in Basic, not Apple. They also forgot the ASCII delete character in the Basic keyboard, and we both use that to access certain mainframes. But my pre-release version of Macterminal does ASCII delete just fine with Control-Backspace. If you want to complain about Microsoft please join me. There's a perfectly good Microsoft User's Group on Compuserve.

Arrow keys probably come on the numeric keypad. Again that's a cost, size and weight saving for those of us who don't want it. I suspect that arrow keys were deliberately omitted, probably on the orders of Steve Jobs. The mouse/point model allows you to go directly where you want, without typing arrow-arrow-arrow-....
Besides, the machine does have very powerful arrows. They're called scroll bars and they're on the screen. For someone who is often harping on new technology I am surprised you cling to first generation computer interface ideas like arrow keys.

8. "A neat job. Like a Hollywood movie. Go to the star and say you have the script; to the director and say you have a star; to the writer and say you have a director; to the money people and say you have star, script, and director; and with luck you will have made it all retroactively true. If you do

not bring it off, well...

> More Pournelle hype. The analogy doesn't hold, but it sounds good when you're in full flight.

9. "So Apple treats its customers as venture capitalists, and that's all right; but then they will not listen to any suggestions (you cannot imagine how many PLEADED with them to add another drive, or at least have the extra drive available when it came out) and to keep the price at something reasonable is not within their intent.

> No they don't. I don't know anything about suggestions, but with all the money Apple spent and with the future of the company riding on this, you can bet they listened, and decided rationally. They just didn't take your advice, Jerry. Sorry about that, but it's their money where their mouth is, not yours.
>
> A reasonable price is one where you sell a lot of product (that demonstrates that you know the market and it is worth the price to those who buy) and you make a good profit (that demonstrates your ability to stay in business, support your products and develop future ones, and reward your investors (of both money, talent and time)). Nobody is FORCED to buy a Mac. A 'reasonable' price has nothing to do with cost but with value received. If you make a huge profit so much the better. That shows you really know how to deliver value efficiently and will probably be around for a while. Of course I would like a Mac for $1000, or even $100, but that has nothing to do with a fair or reasonable price; just what I'd like.

10. "Are those facts? Then if it were not an apple product -- if it were IBM -- would you condemn anyone for wondering what all the shouting is about?
Ye immortal gods. Do you wash your own brains, or do you take them to a laundry?

> Now that we've seen that your hysterics are not facts, I guess I am willing to be magnanimous and ignore your last sentence. On second thought, no I won't; it's a good example of another regrettable characteristic you have of attacking the intelligence, good faith, bona fides or just plain humanity of those who disagree with you. If you keep it up, you will eventually lose your god-given licence to participate in rational discussion in a free society. It will happen simply: you will just get ignored after a while.

11. "tell me: why is everything:
WILL be; Gonna be; the "new BIOS will"; Tecmar will-- in present tense, what can a business man do (safely) with a Mac?

> see above.

12, "as to the edge of technology, surely you don't believe that there's anything all that unusal in mac and lisa? the modula-2 operating system is public domain and integrates not only graphics but a debugger and editor; real editor.

Now I know you understand bit-mapped displays, mouse/icon technology, the Xerox Star, the Lisp machines, the Alto, and the PERQ. What Apple did is do a subset cheaply and for a large market. And they added a lot of very usable concepts and software (in the Lisa as a 'model'). Some of their software goes far beyond what others have done. So get off it.

13. "It's gonna be; will be; wonderful. Perhaps. I hope so. But for the moment I see a lot of peole with $2500 hangovers wondering what the micro revolution is all about once they tire of drawing pretty pictures.

I guess the pot's half-empty for you. For me it's half full, with software coming and people beating down the doors of their dealers to get a machine that they can sit down and try to their heart's content before committing one thin dime. Have you gone into any Computerlands lately?

14. "WHY is everything so non-standard?

Read Tom Kuhn's book, "The Structure of Scientific Revolutions." The new paradigm has to break down the old, sometimes (intellectually) violently, unless you want to wait until all the old-paradigm people die of old age. It's a new standard, Jerry, and an overt rejection of many of the old ones. The market is saying it's right, so far. Get with the program or you'll get left.

15. "Why can't we get source code into the mac? when will there be REAL compilers for it?

We will. If you are willing to write 'real' Forth, that will be out in April in Mac standalone. Real Pascal about mid-year in learning form, about year-end in software development form. Real Basic now. Microsoft Basic, whatever you think of it, is an industry standard of a kind; it probably runs on more different machines than any other Basic. I moved a lot of my Z80 cp/m basic software over to the Mac in an evening and it works just fine. Real C by December (stand-alone). Real assembler/debugger by July (stand-alone).

16. "why is the operating system hidden (or WILL it be explained, in which case, why WASn'T it?

It was never hidden. May I remind you that it took more than a year (like two to three) for CP/M's internals to be fully understood and the understandable widely-sold books on it came to market just last

year and this year after CP/M had been out for I don't know how long. Many good magazines (and some not-so-good) are still making a living explaining CP/M's internals in article after article. Inside Mac on the other hand, is out a month after the machine's announcement. You bought it; why not read it?

17. "Look, man I conceive it part of my duty in life to keep IBM from taking over the world; but not by acting like they do. I see a machine with limited memory, lots of room for expensive add-ons, and not much more except really nice graphics--that aren't all that much better than others I've seen.

(I won't comment on what I think you think your duty in life is.) 128k plus a lot of very tight system code in 64k of ROM is not enormous memory, but the Mac is the lower end of the product line. A 1 meg Lisa is the top. Haven't seen that range in any other mass marketed machines. Last time I looked, $2500 machines often had only 64k of RAM and often no ROM. So 128k plus 64k is not shoddy, either. Of course more would be better. How much did the IBM PC have when it first came out? 64K? How long did it take to get more?

18."The screen is SMALL, the memory is small, there is no backup capability convenient to the user; or have I missed something? Tell me what. I am more than willing to listen. But what I get is long essays about how obnoxious I am; how I am not a believer and shold be cast into the outer darkness. But not much logic and few answers.

More Pournelle hype. I don't believe anyone wrote long essays on how obnoxious you are; just short comments suggesting you were not playing with a full deck of information and being very emotional for reasons we still don't understand. The screen is, of course, smaller than some and larger than others. It depends on what working distance you like whether it is SMALL, or just smaller, or maybe even small.

We really don't want you in outer darkness. You are a pretty good science-fiction writer, and have a following in your computer columns. All we want is a little balance and realism together with rational discussion instead of flaming and name-calling. Nobody expects you to kiss the hem of Apple's garment. By the same token you might want to stop and think whether when people disagree with you it's because of logic, facts and professional evaluation, not because they watched a television commercial and their brains turned to mud.

19. "Is the answer in all cases "Wait and See?" In which case: what do you think--objectively now--about companies (other than your own) who produce machines and induce people to buy them with the "well, no, it doesn't do much YET, but WOW will it be GREAT when we have enough of your money ..."?

Really, Jerry, you'd make a good populist. Apple never said
that nor is it true. Most of the improved features people
want will come from third party vendors, not Apple. It's
their stated policy. It's what's happening. And it's not
an inducement, nor did anyone ever use it. I bet your comment
sounds really good, though, to those who believe the world is
a conspiracy run by "them."

20. "What have I missed? In all the conversation, I get
nothing to think about; only invective; which leads me to reply
in kind, generating heat but little light.

Now that is pure hyperbole (that's what they taught me to call
bullshit at the London School of Economics). I sent a private
memo to your MIT-MC mailbox with technical comments
and an offer to provide more information.
I hope we can stop now and return to rational discussion.

ReSent-To: info-mac: ;

1. Where on Compuserve are the Basic Macintosh Programs stored? What is the procedure for downloading them (What commands will access the specific section of Compuserve)

2. How can you edit a large text file (created with Mbasic), with MacWrite when the Clipboard reports OUT OF HEAP SPACE. I have only been able to edit small text files by sending them to CLIP, then pasting in MACWRITE. Even then, I find unusual trash characters strewn throughout the document.

3. How do you turn a MBASIC text file into an Mbasic program... (ie, you download a basic program, save it into a text file, and want to push it directly into basic (instead of typing it in yourself)) [the solution on the Apple would be to use the exec command]

4. Are there any calls available from Mbasic to put an accesory, such as the clock, at a certain position on the screen.

5. MBASIC bug: Accessories cannot use the cut and paste menu. When Mbasic is loaded, the Mac forgets all disks that is had lying on the desktop Microsoft told me this was done because memory was needed for other things.

6. MacPaint suggestion: Always put Macpaint on a start-up disk (one with the system folder), and run it from that disk... otherwise excessive disk swaps will result, every time you move the picture around, or use the TEXT entry mode.

7. Today, I received a packet from Microsoft which was labelled "Calling ROM Routines. It mentions that the Quickdraw programmers Guide is available from Apple. If you need any specific information on the Quickdraw routines drop me a note, and I will check the packet for information. The subtitles are:

Parameters
    Rectangle
    Cursor
    Pattern
    X,Y Coordinates
    Miscellaneous integers
Functions
    <descriptions of each of the Calls listed in Appendix E of the MBasic manual>

In addition, there is a 32 line terminal emulator called smallterm.bas which

is useful for those who don't want to type in MacTEP... smallterm.bas sets the baud, parity, stop bits, data bits, and goes into terminal mode.

8. I have heard rumors that the 256K chips will be available in June... Has anyone heard similar things?

9. I was told that MacTerminal (originally scheduled to be released in April is not going to be available until June... (this was told to me by a (make that an) Authorized Apple Dealer.

That's all for now... I will appreciate any help you can offer...

Joel M. Heller (jmh@BNL) or (!philabs!sbcs!BNL!jmh)

Subject: Lisa 2 questions

ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

I'm in the dark about a number of things concerning the Lisa, and I can't seem to get questions answered elsewhere. Help would be greatly appreciated.

Concerning software:

Are there any good DBMS systems around? LisaList isn't very impressive. How about word processing programs more powerful than LisaWrite? Can they be integrated with the other Lisa office programs (i.e., run concurrently and able to transfer info easily between them)?

What are the improvements expected in the Lisa office programs? I understood that LisaWrite was going to include footnotes. Surely there must be other, more substantial, improvements.

How good is LisaTerminal? What terminals can it emulate?

One problem I noted with an upgraded Lisa I running with a hard disk was than it was very slow to open new files and 'tools' (10-30 seconds). Is any improvement to this problem in sight?

Concerning hardware:

Is there any different between the Lisa II/5 and Lisa II/10 other

than the disk capacity and the hard disk being inside? Is the I/O done any faster?

How much of the 5M with the Lisa II/5 is used to hold the tools, and how much is left over for work space? How significant is the redundancy - in other words, how much space is really available for data files?

The clearest font off the Lisa matrix printer wasn't nearly as clear as what comes off the Epson FX-80. Is it possible to configure the Epson with the Lisa without giving up any printing capabilities? If not, are there other dot-matrix printers other than what comes from Apple that I could use?

Are there any other significant hardware/software problems that I should be aware of (apart from any philosophical differences people may have with the Lisa/Mac approach to computing)? I'm willing to live with the speed difference between the Mac and Lisa, and intend to take advantage of the Mac emulation on the Lisa, but understand that I have to give up multi-tasking to do it.

Steve Vinter

In the way of response to Randy Frank's message concerning "How can Davong use the RS-422 port for the hard disk?"... this is simplicity itself, since the Mac is made to be used with central devices on the A-Net. The RS-422 IS the connection to the A-Net (PLEASE, someone correct me if I am wrong, this is what Apple seemed to say when I spoke to them after an on-campus lecture). This means that any device capable of acting as a netted device on A-Net (I assume this is how the Davong unit does it) can be accessed over the net with the proper leading message requesting the hard disk. The real question is.. how fast is it? The RS-422 port has a maximum speed of 1Mbaud and that, combined with the net style data transmission should degrade the effective speed of the hard disk.

Harry O.

Douglas Engelbart, inventor of the mouse, gave a talk at Xerox PARC a few days ago. He commented on having used LisaDraw, and how tired his right arm became while his left arm dangled uselessly at his side. Around the time the mouse was developed, there was also a "keyset" which had five keys for the left hand to chord. This would let you enter characters that would be treated as commands or text to enter. This is something he is used to.

This illustrated something I don't like about the Lisa and Macintosh user interfaces: they overload the mouse. Most operations are invoked using the mouse, rather than also using function keys. Though there are control keys to invoke some operations, they are hard to remember, are different for each application, and difficult to use since you must press the control key at the same time you press the letter. For instance, while in the Finder, control-I (which is a bit hard to type) does Get Info, while in MacWrite control-I does Italic. Notice also that control-P was not used for Paste since it's so awkward, but instead control-V, which is non-mnemonic.

It seems that Apple became mouse-happy and tried to make it do too much. This may have justified the lack of a row of virtual keys on the keyboard, or at least keys for commonly used commands, like Cut and Paste. They tried to move away from the keyboard rather than melding it with the mouse.

Although MS-Basic isn't PL/I or even Pascle I myself
have no major complaints. The editing system makes I.B.M.'s
version look like the obsolete code it is. But, in truth, I
will most likely drop MS as soon as MacBasic comes out. For
those of you who haven't read it's description in Byte
I strongly recomend it.

A few Notes on Basic:

As previously noted "Clear,25000" gives the user more programming space,
but only at the expense of the heap. Well, after using that command,
I felt like I was programming in sludge. When I tried scrolling my
list window EVERY SINGLE LINE had to be called off of the disk.
I tried some fiddling around and found that around "Clear,20000"
is the largest clear statement that will give you more memory, but not
kill the systems speed. The system boots with a "Clear,14***" already in
process, so you can acquire about another 5K with "Clear,20000"

I think it is great that people can transmit bug reports so conveniently to
Apple via this mailing list. I am wondering, though, whether, and if so
when and by what mechanism, we can expect to benefit from our efforts. The
written material that accompanies Apple software says that Apple takes no
responsibility for its working properly, and gives no hint about whether
users can ever expect to be given bug fixes. Does anyone know whether Apple
plans to distribute debugged code to those who were brave enough to purchase
the early release versions?

What follows is a program that examines and (optionally) changes the FileDataType of a Mac file. After, changing the type of, say, a MacTEP downloaded file to TEXT (case is supposed to be significant), click MacWrite, shift-click the significant), click MacWrite, shift-click the file icon, then click (File menu) Open.

ReSent-To: info-mac: ;

In a post around Apr. 4, Ben Hyde warned not to empty the trash when there is an info window open on a document in the trash can. His warning was a bit understated. The first time I did this (on purpose, using a trash disk), the "serious system error ID=02" (bomb) box appeared, and the system restarted just fine. Unfortunately, the second time (on another, useful disk) had more serious results. Attempting to boot with this disk causes the "sad Mac" icon to appear, with code 0F009D (I'm not certain of the 9D part, but it's definitely two digits, so it's not in the table posted earlier). Attempting to use it while a system is running produces the "This disk is unreadable; do you want to initialize it" message. I hope this bug is fixed in the new Finder.

I think the idea of a very small & fast editor is great! Using the
routines which are already in Rom for editing and disk access, you could
build something which takes up *very* little space (it could fit on each
of your disks & would load quickly).

I doubt it would take much assembler glue to put those routines together
into an editor. No fonts & possibly undo -- not something to write a
paper on, just enough for a small quick change.

     Mike

This version allows setting (or not) both file type and creator. FYI, to
make a file into a MacWrite document, use type=TEXT and creator=MACA.
I'm sorry that mailers, systems, etc., will certainly chop the long lines
of this program into shorter statement fragments.

Yes , 256K chips are currently available. At present they run around 65
dollars a shot though. Considering that you will require 18 chips, it
will cost aproximately $1,170.00 to upgrade your Mac to 512K. These
prices are for the mitsubishi 256k chip, pruchased through CYTK. I
would be happy to order any chips that you may desire, but I would be
much happier if someone could fine a cheaper sorce.

ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

Having used MacBasic and MacPascal for several days now I've noticed a couple of things. For one doing graphics is exceptionally easy. I haven't seen or used MS-Basic for the Mac but I haven't found the plethora of bugs that previous posts have mentioned being in MS-Basic in MacBasic. One problem with MacBasic (this version anyway) is that they use a scaled 12 point font and it resembles on the screen a degenerate San Francisco Font. The Only 10 Point font I've seen is Seattle 10. I've tried playing with FontMover but haven't had any success in making the scaling problem going away.

MacPascal uses three windows (Program, Text, Drawing) where Program (obviously) is your current program you're working on. Kind of like MacWrite style editing. Auto indent and auto-bolds reserved words. (This is real nice to work in) Some simple drawing routine are provided for drawing lines, ovals, rectangles, etc... You can invert as you draw, thus getting a kind of X-oring feature for overlapped objects. A very nice tracing feature is provided and a little indicator shows you where in the program you currently are. Most commands allow you to use the Command key instead of Mouse hunting all the time. The Text window is your Writeln outputs and your drawing window is graphic output.

Psacal seems to have a stack problem with more than 200 procedure or subroutine calls makes it bomb out. Hope this gets fixed...

Whoever wrote the referenced messsage is absolutely correct. The
original design of an Alto-like successor machine with a purportedly two
to one performance ratio over the Alto ran its macro-code at 190 KIPs
when no I/O was running, and the display was blank!! In its original
design it took 9% of the microcycles just to run a blank display. The
original design sampled the mouse during the display retrace time so the
machine had to do a task switch into the display task to sample the
mouse even when the display wasn't running. I believe that design goof
was fixed, but it shows how much an Alto-like implementation degrades
macro-code performance to handle all of the peripherals through the
micro-code. The microcode is involved with every memory transfer for
every device so any significant I/O bandwidth drastically reduces
macro-code performance.

It was characteristics such as this that were, in part, the point of my
previous message about the inadequacy of an Alto implementation as a
marketable product. Notice that I no longer use the phrase "productize"
in this context.

Dear Apple,

Can we conclude that Macterminal will do the "right thing" wrt to file transfers, namely that MacWrite documents, MacPaint documents, etc. can be transferred to the remote system and retrieved, and still appear as the appropriate document type? This (1) will allow remote file archival, (2) will allow file interchange between Macintoshes, and (3) will allow us to get our grubby hands on all the bitsies the Macintosh applications have access to, so e.g. we could write a laser printer driver for our local system. Seems like two transfer modes would be useful: straight text, and data.

On another note, it seems ashame that there isn't a simple text file editor on the Macintosh. True, there is the notepad, but there can only be one of them. How about named notepads, or someone suggested it would be nice if you could "tear a page off" of the notepad and put it in a file, which you could put into a folder and could later inspect by reading back into the notepad. How about something like this in future versions of the system?

Bruce Lucas

If you have MacPascal running, could you try the Sieve of Eratosthenes benchmark from BYTE? A lot of people are impressed with MacPascal's reported features, and would like to know how fast it is, how long programs can be, etc. How much of a serious tool is it?

I'm a little confused about the comment in MacTEP about the connections 3->7, 5->2, 8->1, 9->3. What happened to DTR? Is it safe to connect the 12V pin to the DTR pin on the modem, as Edward Tecot suggests? I am not the world's greatest RS-232 expert, obviously; does DTR want a 12 volt signal?

I have a Rixon 212 modem, if that makes any difference.

I think the idea of a very small & fast editor is great! Using the
routines which are already in Rom for editing and disk access, you could
build something which takes up *very* little space (it could fit on each
of your disks & would load quickly).

I doubt it would take much assembler glue to put those routines together
into an editor. No fonts & possibly undo -- not something to write a
paper on, just enough for a small quick change.

There is a simple text editor called "File" distributed with the Lisa toolkit.
This program is a multi-window version of MacWrite without all the word
processor fluff. I've used it quite extensivly to edit files locally on the
Mac and later upload them to a host with MacTerm. One of its strong points
is the availability of the well-commented source, which makes adding features
relativly easy.

I got piles of friendly and 'not so friendly' mail, asking for more info
on the contents of the editorial.

I understand that Jim Seymore is a nationally syndicated writer, and a quick
check with your library might show that they carry a paper who subscribes.

In reply to those sending 'friendly' notes: I was torn between posting a
simple quick pointer to the column, or nothing at all, as I did not have the
time to summarize, not to think of typing the complete column. Maybe I should
have waited until I had more time, or not bothered, but I thought you folks
know that a simple call to the local library opens up a realm of information.
As those of you who know me from other groups may attest, I, often, spend
significant time typing, to pass on as much info as possible, but yesterday
there was no free time. However, I'll try to get a list of the major papers
that carry the column, either from the paper, the library, or whereever.
Maybe some of you who have seen his column in major papers could help me and
post a note.

To the 'unfriendlies', I'd like to say "Eat it, and, hopefully, Choke".
I am not 'stupid enough to think that you are all in Austin', or 'reading
the Austin paper', my pointer to "syndicated editorial" should have made
clear that that was not expected of you. I made reference to the printing
date in the local paper as a helpful hint, as other papers should be
printing it around the same time. I introduced the column as an
"interesting viewpoint" and am not 'preaching the new gospel', I don't
preach at all but provide information to help others make up their own
opinion. And rather than give my opinion to the uninitiated questioner,
I have him read what others have said, rather than talk my lips bloody.

     why do some people always seem to foam at the mouth ?

          Cheers, (trying hard to)
                   Werner -------

[Ed. Note - In remailing Werner's original message to INFO-MAC, I assumed
readers would understand that with Jim Seymour being a syndicated columnist,
this source of information would be available to everyone if they chose to
pursue it, and not just the readers in Austin. The mention of the Austin paper
was taken as a courtesy to those on the list at Utexas. I, along with Werner,
thought readers would understand that and not bitch. Enough said. In the
future, please think a bit before clogging the net with flames.]

Folder information is kept track of in a hidden file -- Desktop File (?)
which the finder maintains. What I find irritating is that since folders
are not real, i.e. known by the O.S., an application cannot create a file
in a folder. So even though I keep BASIC programs in a folder, whenever I save
one it finds its way back to the desktop. I assume that the Finder upon
discovering a bad disk decides that the desktop file is bogus and throws it away.
Thus you get a pristine desk with all your files lying around in the disk window.

  column, regularly. My posting this should not be construed
  that my personal opinion is identical to Jim's, but rather,
  that I consider this an excellent introduction to the topic. Werner]

     The MAC is a Great Machine, but Beware the Software Gap
   ==
     (Jim Seymour's syndicated column: MICRO BUSINESS, mid-April)

I feel like I've spent two months answering one question from

readers, clients, friends, strangers: "Should I buy a Mac?"

Take your choice: Yes, absolutely; maybe, not yet. .. depends on
what you want to do with it, and when.

The Mac is a brilliantly designed, very compact, very powerful computer.
It's absolutely the easiest-to-use computer in existence, in many
ways it can run rings around [most other micros]. It's
footprint is no bigger than a piece of stationary. And it's
cheap, at $3600 including a good dot-matrix printer, word
processing, graphics, and spread-sheet software, it's a bargain.

But, there's not much software yet, so it may not fulfill your needs
for awhile, otherwise you should run, not walk, and plunk down a
deposit at the nearest computer-store, because the Mac is not
only the third industry standard, behind Apple II and IBM's PC,
it's also going to be a very important machine for the rest of
the decade. And the software-gap won't last long, as Softcon in
New Orleans showed lots of half-finished products under development.
[a list followed; BPI accounting, Think Tank, pfs: file
and report, Lotus 1-2-3, among others]

But if you want a business machine to use tomorrow morning, the
PC [and clones] has a big lead, and will always have more
software available, the MAC will never catch up.

....

To hell with making people computer-literate. I want computers
that are people-literate. The Mac's a fine start.

Great, but can people without the Lisa tookit get that editor?

Apple: Like it or not, people ARE going to want to develop software
for the Mac on the Mac, since not everyone can afford a Mac and a
Lisa. Unless you want Mac to be "the computer for the rest of them,"

you ought to keep that in mind.

Rather than wasting time writting yet another small & fast Mac editor,
I suggest some work be done on decreasing the time to open and close
an application. This is the heart of the problem. MacWrite is small
and easy to use, its just slower to launch than the notepad.

Decreasing launch time would help every application. For example,
consider a phone directory. Who is going to wait 15-20 seconds for a
directory application program to open just to find and dial a phone
number?

Mike

The information we have is that Apple very definitely plans on a Mac-based
Mac development environment. However, we understand that it will require a
.5MB Mac (256K ram chip version) Mac, and so won't be available until the
upgraded Macs are. We have also heard enough to believe that the delay in
the Mac-based development environment may more likely be the .5MB Macs than
the software.

Newsgroups: net.micro
Subject: Re: Well written Macintosh overview (comments on comments)

When the Mac was first announced officially, and could be seen here,
the people with most immediately enthusiastic responses were precisely
those people who have been deeply into computers for years. They could
appreciate the wonder of the Mac faster than the "users" (non-novice but
non-wizard). Having been involved with computers for 30 years now, I
found myself with that quick "This is a real machine -- it's RIGHT" reaction.
After 6 weeks of using one, my main finding is that now my writings
have many more figures in them and are easier to read. No programming
support yet, but what a joy it is to use the things that are there.
Programming will come.

ReSent-To: info-mac: ;

Well all is not cheery on the MacPascal front...
I used the Sieve version appearing in the Jan. 83 Byte issue p284.
Here's what the program is:

```
program prime;
const
     size = 8190;
var
     flags : array [0..size] of boolean;
     i, prime, k, count, iter : integer;
begin
  writeln('10 iterations');
  for iter := 1 to 10 do
     begin
       count := 0;
       for i := 0 to size do
         flags[i] := true;
       for i := 0 to size do
         if flags[i] then
          begin
            prime := i+i+3;
               k := i+ prime
            while k <= size do
              begin
                flags[k] := false;
                k := K + prime
              end;
              count := count + 1
             end;
         end;
  writeln(count,' primes')
end.
```

As I typed it in, it did a nice job of auto-indenting, bold facing
reserved words. There are step, trace, run, stop, reset functions
when using your program. Menu or Keyboard.

So I tried to run it.
First problem it didn't like program prime and var prime. Foo.
so I change the program name to prim.

So I tried to run it.
Second problem it didn't like size used in the var field. Foo
so I change size to it's value of 8190.

So I tried to run it.
Third problem: Not enough memory for an array of that size!

The error message says "Install 256K RAM Chips" Right...

I don't understand that. The boolean array undoubtedly can be
8191 bits in memory or 1K of RAM, and there should be plenty
of space for that! So I reduce the size and finally runs at an
array size of 600, (it failed at 700 and I didn't try iterating any further)
It takes 1 Min 14 seconds to do this... Not Impressive.
Remember though, it's interpreted not compiled. I would guess a compiled
version would run an order of magnitude faster (at least)...

Other Bugs: File I/O, Sets, readln w/ No arg...

Does anyone know of any way to print multiple copies of MacPaint
documents? I have found that I can create duplicates of the file,
select all of them on the desk top, drag down through the FILE
menu to PRINT and MacPaint will print each in turn. Unfortunately,
I am bounded by disk space. Is there any "hidden feature" or trick
that will allow me to print multiple copies from one MacPaint
document without "OPERATOR INTERVENTION"???

Also, has anyone out there given any thought to hooking up a video
camera (such as the one described in Byte September 1983 (?))? It is
rumored to be available with a RS232 interface.

Cheers,
-Abdul-

Well, at about 50k MacWrite doesn't exactly qualify as small on a 400k minus system stuff disk. It's overkill for random notes. What I was hoping for would be a small editor as a desk accesory. The parts are almost all there: the notepad and the scrapbook. What is needed to make it really useful is, say, multiple named scrapbooks that you could keep in various folders.

New issue of MacWorld came today:
here are some tidbits....

new version of MacWrite will be available. Includes superscript and subscript options in Style menu, and revisions to header and footer.
No mention of cost (if any) and when...

Macintalk: phoeneme program for ASCII to speech. Same guy who did SAM for Apple II (anyone familiar with this?) Looks real interesting, and you can use Basic or Pascal to make calls to it.
Apple plans to use it to replace the audio cassettes for the Guided Tour.

Trivia:
That sensational TV ad shown during the SuperBowl was also shown earlier. Specifically at some small station in Twin Falls, IDAHO KMVT on December 15 at 1 in the morning it was shown. This means it was shown in 1983 and could qualify for the 1984 Cleo Awards!

Article on Disk Juggling to optimize number of swaps necessary.
Hopefully articles like this won't be necessary in a few months!

Ads for a Magic Phone Dialer, prints details of each call (time number charge) mouse used to select and dial. retty nice for checking MCI/Sprint bills.

Article on the Lisa and Microsoft Chart: nothing new...

One company advertising professional typeseting for the Mac.

An article on Macintosh Pascal.

There's an excerpt from Cary Lu's Book also and an article on

the Apple university consortium. Also an interesting look at te
international Mac marketing effort.

Just received this in the mail (I am surprised the second issue came out so soon.)

Good article called "The Compleat Disk Juggler" on how to use your single-drive Mac more efficiently. Contains specific instructions on how to use the FontMover and some suggestions on how to set up working disks.

Review of MS Chart--lots of pictures.

Article on Lisa 2. Interesting photographs of Lisa screen running Mac software--the aspect ratio problem is amusing.

Other articles (of course) about the Apple University Consortium (looks at Brown, Stanford, U of Michigan); international versions of the Mac; preview of MacPascal; etc., etc.

Notables from the "Macworld View" section:

John Rizzo (Apple hardware product manager) says 512K Macs may appear in early 1985 . . .

Apple will be selling Alice (for under $40, of all things) . . .

A new version of Macwrite "should be available from your dealer soon." Fixes to Header/Footer problems, subscripts and superscripts . . .

>From the "Disk Juggler" article:

The new version of the Finder will include an option to to specify an application to run on startup. Performance improvements have been made in the boot procedure and in restarting the Finder after an application exits.

Warning: opinion begins here.

The second issue maintains the rather innovative graphic layout of the first: lots of whitespace, lots of photographs and screen dumps. I think it will be interesting to see what happens as the magazine grows in terms of advertising copy (there are, btw, a number of new products advertised in the second issue). Most of these computer mags tend to be dominated by ads starring PC boards. I do not think PC boards are particularly lovely to look at (you may think otherwise). In Macworld, ads like that will make even more of an impact. Then again, no one should be advertising PC board-level products for the Mac, anyway . . .

We just received copies of a 'magazine' called "AppleView", which is a publication of the Marlboro Technical Support Group, 171 Locke Dr., Marlboro, MA 01752. It appears to be a newsletter that is sent to dealers of Apple equipment (I assume that we're getting it because we're consortium members). Older issues focus on the Lisa and the Apple II, but issues from February '84 onward also contain Macintosh material. I have no idea whether this newsletter is generally available to Mac owners, so I'll try and summarize useful info on this list when I discover it. Here's what I've found so far...

2/84 issue:

Two-page article on inserting tabs in MacWrite, w/no info that isn't in the manual already.

1-page summary of assorted Macintosh info, including:

1) The Mac currently supports only the Imagewriter, though other drivers may be developed in the future by Apple or other vendors.

2) A few of the Imagewriter cables went out incorrectly wired. If pin 20 is clipped, try setting switch 3 on bank 2 to the off position, enabling Xon/Xoff protocol, and it will probably work.

3) The Guided Tour and MacTest diskettes can be copied, but only on a two-drive system. The guided tours require a cold boot before insertion.

4) Pictures copied from MacPaint to MacWrite will appear lighter upon printing.

An article on fonts, w/no new info.

An article on cutting and pasting between macpaint and macwrite. One new fact is that a double-click on the selection rectangle in paint (the "marquee") will select the entire drawing window.

A 2-page article on the Mac Alarm Clock accessory, which mentions that the Mac manual did not include the directions for the clock. For those who were wondering, here they are, minus the illustrations.

a) To get the alarm clock, pull down the Apple Menu and select Alarm Clock.

b) A small window will appear, containing (from left to right) a close box, the current time, and an unnamed symbol. Clicking on this symbol "opens" the clock mechanism by adding two additional lines under the original window. The upper line contains the clock/alarm setting equipment, and the lower line contains three icons, as follows from left to right: clock face, calendar, and alarm clock. These are used in combination with the line above as follows:

By clicking on the clock-face icon, the setting window can be used to change the current time of day via the up/down arrows or clicking on any of hour, minute, second, or AM/PM and typing in the new setting.

By clicking on the calendar icon, the current date can be set in a similar manner.

By clicking on the alarm-clock icon, the time when the alarm will "ring" can be set in a similar manner. When this icon is clicked, the left side of the 'setting' line will contain an additional icon, of a two-position switch. Clicking on this switch will change its setting. The switch is used to turn the alarm on or off, and the current position will be visually displayed via the alarm-clock icon below.

Closing the alarm clock window can be done whether or not the lower section is displayed. The icon on the top line which opens the mechanism can also be used to close the mechanism, but not the alarm clock accessory itself.

When the alarm is set and the selected time is reached, the speaker will beep once and the Apple Menu symbol will begin to flash. This flashing will continue until you select the alarm clock once again. (This explains why, on occasion, this symbol is flashing at startup time -- the alarm was set when the system was last used.)

3/84 issue:

Good one-page discussion of how best to split the Write/Paint disk into two separate startup disks for maximum scratch/document space. One interesting thing here is that the Imagewriter file in the system folder is only needed for MacWrite, not for Mac Paint. Eliminating it saves 17K.

Brief summary of use of Header and Footer windows in MacWrite. Nothing new.

That's it, for now.

I have a disk with some data on it which I would like to keep which the Mac refuses to read. The symptoms are:
1) the machine refuses to boot off of the disk
2) if it is booted from another disk, that disk ejected, and the bad disk inserted, the system bombs
3) in both cases, a "severe system error" "ID = 02" is given and the machine halts

The disk worked quite well for a day and a half. At that time, it had the entire system folder on it. I deleted the "system" and the "imagewriter" files from the system folder with no

apparent harm. I then copied the "system" file back in successfully. I tried to copy the "imagewriter" file back onto the disk, but got a "disk full--use another disk" message. I tried this copy a second time and seemed to succeed.

If anyone knows how to retrieve the data, I would like to know.

Well, you can tell the IWM what speed to spin the disk at, and probably the density too, but that won't let you read HP-150 disks. All Apples (the Apple II as well as the Mac) write their disks in a format called "group code recording", which involves differences in the *analog* part of the controller. It might theoretically be possible to control a Lisa I "twiggy" 5 1/4" drive with the IWM, and maybe even an Apple II 5 1/4" drive, but only if you can figure out the IWM's opcodes and hack up the driver routines inside the operating system.

In the latest (April 11, 1984) issue of 'The Chronicle of Higher Education', pages 14-15, is a piece about the Apple Consortium and the new arrangements for many more schools. Concerning the Consortium,

there are good stories and quotes (from Dartmouth, Mass., Mich., Stanford, Rice, and others) about the waiting lists and lotteries, reselling ads and ploys and counter-ploys, repurchase agreements, and more. As for the new, expanded discount program, it boils down to little more than industry-standard educational discounts: in the range of 20-25% (instead of the near 60% to Consortium members), though it says the discounts might be more for large customers (orders over, say, $1 million).

I do not have a Mac (yet), but I feel I should bring up a point about Kevin's sieve of Eratosthenes in MacPascal.

Most pascals are implemented such that an ARRAY OF BOOLEAN is a different data structure than an PACKED ARRAY OF BOOLEAN. The former, in the Mac's case, takes up either 8 K Bytes or 8 K Words, whereas the latter would take up the 8 K bits Kevin expected. The former is usually associated with increased speed (ie no internal packing or unpacking is required) whereas the latter is, of course, associated with decreased space requirements.

I realize that changing the ARRAY to PACKED ARRAY may change the nature of this benchmark, but I think it is necessary to get at least some idea of the relative speeds. Perhaps Kevin or someone else would care to make this minor change and report the results?

Christopher Ho
Chris@Usc-Eclb

ps The PROGRAM PRIME/VAR PRIME bug sounds annoying but livable, the inability to use the CONST SIZE a definite bug. Could you elaborate on the 'other bugs' regarding File I/O, Sets and ReadLn?

ReSent-To: info-mac: ;

In case some people do not have access to the May/June issue of MacWorld, here is the description of the Alice-in-Wonderland game for the Macintosh:

---------- Begining of article

If you like fast-paced video games and know how to play chess, you'll want to try a three-dimensional animated chess game called Alice. This new game by Macintosh programmer Steve Capps takes Alice out of Wonderland and puts her on the Mac screen.

We looked at a prerelease version of the game, which opens on a woodcut graphic of a medieval figure playing chess and then shifts to a chessboard. Six chess pieces zoom to the front of the board, and you select a piece to indicate which powers Alice will adopt (for example, if you choose the Queen, Alice can move in any direction, any number of squares). You have only one piece, Alice, to play against the game's complement of chess pieces.

Your score is posted above the board. When you take a chess piece, your score increases; it decreases when a piece takes Alice. To obtain a perfect score of 999, you must capture all the chess pieces, never let Alice get captured, and let all the pawns more to the front row and become queens before capturing them.

Capp's future plans for Alice incorporate the construction trend in software games-- letting users access programs and redraw the game figures as well as redefine their functions. In Alice the user will be able to redraw the chess pieces or change the expression on the faces as the pieces move.

Apple estimates that Alice will be released in May, for under $40.

------- End of article

>From the small picture included in the article, the three-dimensional effect is achieved by having pieces in the front rank drawn bigger than pieces in the back rank. The enemy pieces face you, and the Alice figure (a little girl with long hair in a dress) faces away. It's a really

cute game.

I wonder how well the Mac plays; any fair player would be able to defeat
a single Queen.

(1) Locking a document doesn't prevent its being overwritten with MacWrite!
    The Macintosh manual does not say that locking protects a document
    from destruction by application programs, but it is pretty useless if it
    doesn't do so. It won't let you deliberately drag the document into the
    trash, but it will let you accidentally save something entirely different
    on top of it.

(2) If you change the font/style for text you are about to write (in MacWrite)
    and then startup the Notepad before actually putting any new characters
    into the MacWrite document, the font/style change is undone. The Notepad
    should save and then restore the current font/style if an application
    program is running.

ReSent-date: Fri 20 Apr 84 15:16:52-PST
ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

     If you print a MacWrite document in "tall adjust" mode, you probably
shouldn't extend the default width of the text line (in particular, don't
move the right margin to the 7 3/8" mark). Extending the line width can
cause the final character to be lost on the Imagewriter output.

Printing text with "tall adjust" produces nicer looking output than the default mode.

With regards to the upgrade of the FINDER, MACpaint and MACwrite, the dealers should be handling the actual upgrade, and it will be free. Apple will not get any money as a result of the upgrade, although the dealers may make a small charge for the media.

Please don't ask me any questions on this, as this is all I could find out at the moment from Apple.

(the Management page of the business section of the Saturday, April 28, 1984 San Jose Mercury News included the following item, reprinted in its entirety.)

@b{Management changes}

Alan Kay, who recently resigned as a "fellow" at Atari Inc., will join Apple Computer Inc. next week with the same title, his office said Friday.

Kay reportedly was recruited heavily by Apple chairman Steve Jobs but apparently convinced Jobs to let him do most of his work out of his home in Los Angeles.

An Apple spokesman refused to comment Thursday.

When Kay left Atari earlier this month, he said he wanted to "persue some

very basic work in artificial intelligence." Kay is best known for conceptualizing the "Dynabook," a small computer that would seem as much a part of a person as his arm or leg.

The Japanese Macintosh indeed poses a set of problems different from the modifications required for European products. We want to find the best way to make Macintosh approachable, attractive and affordable to Japanese customers.   Xerox J-Star, IBM 5550 and NEC PC-100 are some of the systems we have evaluated in our quest for solutions and models. The phonetic input method is indeed becoming a standard way to tackle the problem of Kanji. Better solutions (such as Xerox's J-Star) do grammatical pre-processing before conversion into Kanji, thus significantly simplifying the task of the typist. Meanwhile, Apple will put out a Kana Macintosh as a stopgap solution until the full blown Japanese (Kana/Kanji) system is ready. The majority (if not all) of the Japanese MANAGERS do not type and prefer to handwrite their notes: a keyboard is still associated with a typist or secretary. Simplifying the typing process will certainly help in making

computers more appealing to managers. I hope this answers some of the
 questions raised by the Macworld article on International Macs.

Joanna K. Hoffman
International Marketing Manager

When people point out the "flaws" in the design of the Macintosh, the one most frequently mentioned is the absence of a second built-in floppy disk drive. This seems to be a recurring theme in both computer journal articles and the `info-mac' mailing list. For example, here's a "typical" comment, quoted from the famous Macintosh review in the Feb. 84 issue of BYTE Magazine:

> I also feel strongly that the basic Macintosh package should include two disk drives. With a one-drive system, it will take at least eight disk swaps to back up a 3-1/2 inch disk. How many people (especially novices) will go to this trouble, and how many will suffer when they don't? (I am not alone in feeling this way; the first thing two BYTE editors said when they first saw the Macintosh was, "Only one disk drive? You've got to be kidding!" After numerous disk swaps when trying to load MacPaint from one disk and a drawing from another, I am convinced that most users will eventually buy the second drive.)

I am a little surprised that no one (even for the sake of playing devil's advocate) has expressed the opinion that the single-drive architecture is "a good idea" or even "OK".

In order to judge the wisdom (or lack thereof) behind the design decision, we need to consider the potential uses of the Macintosh. I have attempted to categorize the possible approaches according to disk configuration options. This list is not necessarily all-inclusive:

1) The "Spartan/Cheapskate" Approach: one built-in floppy drive (period).
   Suitable for students, hackers, or anyone else who doesn't place a
   high premium on the value of his/her time. The user does backups by

multiple disk swaps (tedious but effective) or choses to not do backups at all. [There *are* applications where losing data and/or having to regenerate it is a minor inconvenience rather than a disaster, and the cost of doing the backup has to be weighed against the cost of loss multiplied by the probability of loss. Those of us used to storing large original documents (such as program sources or collected raw data) may forget that there are cases where the balance tips the other way.]

2) The "Expanded Memory" Approach: still only one built-in floppy drive, but with 512K bytes of main memory. Not an option yet, but we'll surely see it within a year. Apple plans to offer a board upgrade when the denser RAM chips become more economically feasible. Daring hackers could replace the chips themselves. With a half-meg of memory available, copying a 400K floppy could be done with a single swap! One could claim that having a disk with less capacity than memory represented a serious mismatch, although many applications could make good use of this configuration.

3) The "Standard" Approach: one built-in floppy, one external floppy. Only slighly less convenient than having both built in. Yes, it's obvious that it's going to cost a bit more because of the extra box, cable, and power supply (or does the external drive get its power from the Mac?). One could even argue (though I won't bother) that an external drive was *superior* to a second internal drive because the user is "less likely to get confused" about which disk is is which drive.

4) The "Professional" Approach: one built-in floppy, one external hard disk. The preferred configuration for many business applications. I understand that compatible hard disks are already available, and more are on the way. Certainly more cost-effective than floppy drives when judged on an on-line-bytes-per-buck basis, and the prices should continue to drop as these units become more popular.

5) The "Workstation" Approach: one built-in floppy, one serial line to a local or remote host mainframe. The Mac can be used as a (very) intelligent terminal, and can off-load many interactive tasks (such as document preparation and data entry/verification) from the host. The built-in floppy provides local/personal file storage, while the host provides mass storage.

6) The "Network" Approach: one built-in floppy, one serial line to a local area network. Similar to the "workstation" approach, but the Mac is not tied to any particular host -- in fact, the network need not have any "host" computers at all other than the Macs themselves. However, to eliminate the need for a second disk on each Mac, the network should include at least one file-server host, which provides access to large and/or shared data bases and space for back-up buffering.

Notice that option 2) is the only approach that *needs* the cherished second floppy drive. In all the other options, the elimination of the

(unnecessary) second drive represents a savings to the consumer. I'm not saying that we're saving the *entire* cost of the second drive (I haven't forgotten that Apple is trying to make a profit as well as a sucessful product), but we're certainly saving some of it. And while the "Standard" approach is currently the most popular, it doesn't represent such an overwhelming percentage of the potential applications that it makes sense to include an expensive option in every base unit. If the argument seems weak now, wait a year -- I predict that the "Standard" approach will diminish in (relative) popularity as some of the other approaches become more economically feasible and their advantages become better understood.

As for me, I ordered my Mac without an extra drive. I'll start with the "Spartan/Cheapskate" approach (after all, since there's no software yet, anyone who buys a Mac *now* is in the hacker category anyway), see how painful it is, and when the need arises, chose an option for expanding (there will be more options to chose from then). I'm happy that I didn't have to start by buying into an approach that may not turn out to be best for me in the long run.

I chose to buy a Mac, but I was not so blinded by love that I didn't see its faults and limitations. When I compared it to other personal computers, I counted pros & cons. The absence of a second floppy drive was not something that ended up in my "con" column. I think Apple got this one right.

-- Bob Rees

P.S.: The Macintosh *does* have two serious problems related to the single drive, but the problems are not with the hardware design -- the problems are with marketing and software. The marketing problem is obvious: external drives are simply *unavailable*! (My local Apple dealer has never even seen one.) The software problem is even more annoying. From what I've seen & heard, the software seems to have been designed for a 2-drive system, with the provision for disk swapping added as an afterthought. Little attention was given to reducing the number of times the software had to switch from one disk to another (by using clever buffering schemes and anticipating what code & data should be kept in memory). Given that Apple chose to design a 1-drive machine, it's really unforgivable that they didn't bother to optimize their software for the default configuration.

The following is a compartmentalized flame. Feel free to ignore the parts you don't like....

An Interesting (MacPaint) Hack:

If you are in Pencil, and you hold the command key, clicking the mouse button toggles FatBits, and where the pencil on the normal screen is centered in the FatBits screen.

Flame:

Too bad this doesn't seem to be in the manual. It's an excellent idea, and points out a Great Concept in mousing (no claims of origin or originality...): GET BOTH HANDS BUSY! Allowing the left hand to option-modify the command increases the bandwidth of the keyboard and speeds things up a lot.

Daydream:

My vision of the ideal workstation keyboard is one with 5 keys on the left side of the keyboard to do single click, double click, constrained click, etc, and a trackball on the right side. This allows lap operation and shortens the hand travel distance. Trackballs can be made to be much more precise, too. It might become possible to do freehand drawing (or at least make it easier).

I might (in the far future) hack together a mackeyboard like that. If any computer company wants to bring out a keyboard like that, by all means go ahead with my blessing. I'd like it.

.....bc

Since I`m getting a bit tired of the 1 vs. 2 drives and 512k

discussions, let me offer the following hypothesis: the MAC was originally designed as a 2-drive, 512k machine. Then Apple discovered that they couldn`t get enough drives from Sony and that 512k was too expensive to make it to market before 1985. Not being willing to wait til then, they modified the design to get it out (it was already late). Perhaps (the clue is some software that takes color) the original design even had color. If this is so, it makes some of the handsprings Apple apologists have been turning a bit silly. (I write this as a supporter of the Mac and an Apple registered developer--just want some reasonableness to the discussion.) Note that the hypothesis is entirely my own; I don`t know anything official from Apple about these matters. --david--

Yes, not very much is documented in that small
pamphlet for MacPaint. On the other hand: 1)
that pamphlet does not claim to be a manual
for MacPaint (read the first two pages), & 2)
the feature you found IS documented, along
with several other fun things under the
Short Cut entry in the Goodies menu when
you are in MacPaint.

I wonder if, since there is also an Introduction
entry in the Goodies menu, Apple never
intended to give ANY printed documentation
on MacPaint... As many of my friends have
proven on my mac- you can just start playing
and never read the printed doc. Pretty
amazing concept!

Bug: MacWrite hangs when trying to initialize a disk for saving current
     file.

Repeat-by: Use save as... then eject current disk and insert an
     uninitialized disk. Click Initialize in the next dialog box.
     And you'll stare at the message "Initializing Disk" forever.
     There's not even a whir of disk motion.

I tried an interrupt (left hand side "programmers button") but a serious system error ensued. Luckily the file was already saved on another disk.
Caveat,
len

Comment: An answer to Bill Coderre....
ReSent-date: Wed 2 May 84 12:23:27-PDT
ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

If Bill Coderre wants something for his left hand to do while his right hand is

busy with the mouse (a most understandable wish), he might be interested in taking a look at AUGMENT, the Tymshare product which evolved from Doug Engelbart's NLS, which was developed at SRI. That's where the mouse itself was invented. Its developers recognized the need for a control device usable by the hand not busy with the mouse, and developed a five-key "keyset." Looks sort of like a little piano keyboard, sitting (usually) to the left of the keyboard, with the mouse on the right.

We've been using the keyset, together with a three-button mouse, since the late 60's (Doug Engelbart -- Engelbart@Office-2.ARPA) could give you a more precise date -- works beautifully, and does just exactly what Bill is asking for. As a matter of fact, I'm using one now -- mouse and keyset hooked to a PC/XT -- to send this message.

It's nice to see people thinking along these lines. They used to laugh when I sat down at the mouse & keyset.... "What's THAT?" they said....

Regards -- David

The Option-Pencil hack, as well as many others, is mentioned in the short-cuts section of Goodies. You will notice that there are quite a few useful features mentioned there. I prefer having this information there instead of in the manual, for one reason: I don't want to read the manual! Has anyone actually seen a hard disk for the Mac? I would like to know about their reliability/ease of use/availability.

Subject: My (educated) opinion on the Mac's design
ReSent-date: Thu 3 May 84 09:12:04-PDT
ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

The following is the personal opinion of John Howard Palevich, and is not ment, in any way, to reflect the opinion or knowlege of either Apple Computer Inc or Atari Inc. It is based entirely upon publicly available information.

Hi -- I worked on a high-end personal computer design team for a couple of months once, and I think you're all going off the deep end with your Mac speculations. Please remember that Apple is just an ordinary company composed of fallible, short-sighted engineers. The Mac design is great, but it's not part of some grand all-encompassing plan. In particular:

    The Mac will not have color. Ever. Give it up, guys. (More on this later...)

A Mac designer gave an excellent talk at Stanford a while back, during which he gave a bit of the history of the Macintosh:

Remember that the Mac project has been around for a very long time. The original Mac had:

 * a 256 x 256 bit-mapped display
 * 64K of RAM
 * a 8-bit (6809?) processor
 * integrated application software in ROM
 * transportability (original design looked like an Osbourne)
 * a "twiggy" (Lisa-1 style) disk drive

The Mac was (obviously) ment to be a "model-T" machine, with no options.

Anyway, they realized that the ability to display 80-column text was an absolute necessity, so they went to a 320 x 256 display. The 4 x 6 characters that this display produced proved so ugly that they gave up and went to the current 512 x 342 display, which gives an adequate 6 x 8 character size.

A 512 h by 342 v by 1 bit-per-pixel by 60 hz display requires 22K of RAM and a video memory bandwidth of abou 2Mb per second. If you want your processor to have any access to video memory at all, you have to use a 16 bit data bus. (All other things being equal, a 16-bit bus transfers data twice as quicly as an 8-bit bus.)

Sixteen 64K-by-1 RAM chips give you 128K of RAM, and by this time the 68000 had become cheap, and was being used on the Lisa project, so they adopted it.

Inspection of the "Inside Macintosh" manual, "User Interface Guidelines", page 67, dated 10/11/82, reveals a Macintosh which is pretty similar to the one we know today. The only difference is that the disk drive's capacity is rated as 840K.

WHY WE HAVE ONLY 400K ON OUR DISKS

The Mac was designed to use the fabled "Twiggy" drives. These drives, designed for the Lisa computer, use 5 and 1/4 inch diskettes, store 840K by using both sides of the diskette surface, and have a reputation for being unreliable.

Halfway through the Mac project, they decided to go with the fancy new Sony 3 and 1/2 inch drives for a number of reasons which can only be guessed at. I suspect that influencing factors included:

* Sony diskettes could store the same ammount of data as the Twiggy drives
* Sony hardware is superb
* Sony hardware is cheap
* The diskette's physical format was becomming a standard

This design change was made late in the game -- Apple had already made the molds for the Mac cases with the larger cut-outs for the Twiggy drives. If you look at the photos on pages 128 and 130 of the "Premier" issue of Macworld, you'll see Macintoshs with the larger cut-outs.

The only problem was that Sony couldn't make double sided drives in quantity, so we're stuck with single sided, 400K drives for a year or two.

WHAT DO YOU MEAN, NO COLOR?

Just that. Quickdraw has a tiny little hook in it for drawing on multiple bit-planes, and this might be of some use in preparing bit-maps for displaying multiple colors on a color printer. But that's it. The Mac is steeped in software concepts developed solely for high resolution black-and-white displays. Nobody has shown that color is useful for Mac-type applications, and high resolution color monitors are extremely expensive. ($600 for RGBI, MUCH more if you want grey scale.)

Color is superb for games and for pictures, but it requires a vast ammount of RAM, computational power, custom display chips, and expensive monitors. In ten years, everyone'll have a color display, but right now, for a software-intensive, cheap, personal computer, black & white is the way to go.

RUMORS, RUMORS, RUMORS

Careful inspection of the "Inside Macintosh" documents yields some titilating odds & ends. On page 30 of the "User Interface Guidelines", under Desk Accessories, a list of standard desk accessories are given, including: "Telegram Form and In-Box (AppleGram)". I think that this is the tip of the AppleNet iceberg.

In the "Application" section, a printout of some sample application programs are given. These printouts are probably from an Apple laser printer. One tell-tale mark of a networked laser printer is the print-job sepereator, a visual mark printed on the paper to indicate the start of a new print-job. The grey bar running down the right hand side of the first page of each of the listings serves this purpose. (Goodness, it also looks like QuickDraw was used to scan-convert for the laser printer page. My, but a general-purpose set of bit-map routines is useful!)

Although there is absolutely no economic reason for Apple to make a LCD display for the Mac, it's not much harder than the one they're trying to make for the Apple IIc.

The Apple IIc has two serial ports and a mouse port, just like the Mac. At least the company is being consistent in it's belief that the user really doesn't need expansion slots.

WHAT DOES IT ALL MEAN?

1) The Mac's a pretty nifty machine.

2) Apple will make a great deal of money.

3) The guy on the wall-screen in the Mac commercial is more likely to be Mr. Jobs than any of his competitors. After all, the Mac screen is black & white, while the IBM PC is color. . . .

ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

Is there a standard format for transmiting the whole of a Macintosh file, both the data and the resource parts? Is the only format sort of buried inside MacTerm? I'd sure like to be able to transfer files and programes over the phones to other computers. . . .

On a related note, anybody hear of a Macintosh user's group getting started?

I have a column deadline first part of next week. Would appreciate information/comments on:

1. I have sources say that the reson you cannot get your Macdisk fixed if it dies (and many do) is that the replacement drives are being kludged by hackers to make second drives for their systems, and are being bought out the back doors of stores. May not be true, but I can certainly get goot source materials.

2. Is there ANY available applications software for Macintosh as of this date? (Not what will be out next week...)

3. A correspondent tells of buying a Mac which died within an hour. The store quoted a four week time to fix; Apple policy forbids supplying him with one from pipeline and swapping live for dead unit; calls to Apple produced sympathy from those taking call, but return call saying that was indeed policy. (Reader got refund and bought Kaypro.) Is this indeed Apple policy, and if so, why?

I have a Mac. It's much fun. I agree that many people who would never play with computers find it fascinating. Without software, languages, or assembler, it m ay be a bit costly for some of us.

ReSent-To: info-mac: ;

However, if you did read the manual you might find this under the entry for the command key under "Other Special Keys" on page 32:

> Enter and leave FatBits by clicking in the drawing window with the pencil.

On the matter of locking files, and what sort of protection to expect, the Macintosh Owner's Manual states on page 105 that

> The Locked check box allows you to lock a document or application. When the Locked box is checked, that document or application can't be disposed of or replaced (either by saving or copying from

another disk). It can be moved, its comment box can be edited, and it can be duplicated.

So the behavior mentioned previously on this list should be treated as a BUG.

Dear Jerry,

Here's some accurate information for next week's column.

1. The external 3 1/2 " drive for Macintosh will be available for sale at all dealers next week. The Sony drives are extremely reliable, and failure rates are very low.

2. Currently there are 9 applications out for Macintosh:
  MacWrite, MacPaint from Apple;
  MultiPlan and Basic from Microsoft;
  MAGICPhone by Artsci;
  ClickArt by T/Maker Graphics;
  MacForth by Creative Solutions;
  Transylvania by Penguin Software;
  and MegaMerge by MegaHaus.

In May developers expect to ship ten applications (including Microsoft Chart), and in June there should be at least 35 additional applications (eg. Macintosh Pascal).

3. All Apple products are under 90 day warranty. All Dealers are required to stock spare parts for our computers. The Macintosh reliability rate has been extremely high. I'm surprised to hear that this particular person has had trouble with servicing his Macintosh. If he would call Apple (Donna Dubinsky, Manager of Distribution) in Cupertino I'm sure she would be more than happy to help solve the problem.

Hope you continue to enjoy your Macintosh.

Barbara Koalkin
Macintosh Product Marketing Manager

     Here at Rutgers we're interested in using Macs to teach intro
computing courses. The current versions of these courses use Pascal and
Macro-11 assembler. Now the problem...

     We talked to an Apple person and they informed us that
MacAssembler requries 2 Macintoshes, one having the development
environment, the other, a small debugging monitor in its kernel. The
Macs are connected by their printer ports.

     A note in the conversation that seemed even more ominous was
the representative saying that Apple does not plan to produce
standalone development environments for the Macintosh. But what about
the "C" that has been announced for end of summer? Perhaps it isn't
for real?

     BTW, AppleNet has been cancelled whilst IBM finalizes its own
networking plans. Recall that Apple wishes to be compatible with this
standard.

It depends what you call stand alone. Apple has told me that they will have
a compiled Pascal by the end of the year. The problem with both that and the
assembler is that to run the fancy debugger you need two Macs. (You can
certainly develop, compile, and test with just one.) Since the Mac has no
hardware memory management, a program under test could easily write into a
debugger's data space and in any case it would have to somehow share the
screen and limited RAM with the debugger. The interpreted Pascal and Basic
avoid this problem by limiting what can be done, but for the assembler and

compiled Pascal you would certainly want control of the full screen, menus, etc. The fancy debugger thus winds up on a second machine and built into the ROM is some kind of manager which allows the program being debugged to have the machine only sacrificing a tiny amount of RAM for some debugger state. I am sure that there will be languages with "stand alone" debuggers, but they will not be as nice as what can be done with two machines. Maybe when we have 512 you could have a debugger which would have its own copy of the entire screen and you could toggle between the application screen and the development screen.

For Jerry:
I know several students who feel that the Mac already has the programs they need. With just MacWrite and MacPaint they consider it the ideal homework machine. What other serious things could they need? They suggest maybe a spread sheet program (MultiPlan is out and the new version seems to work) and a few games (a few are already announced). They seem to feel that they can do everything on a Mac right now that they would be doing on any other machine and do it better. They would like to see sub/super scripts and longer files in MacWrite but a new release of it has been announced. They claim that they would rather segment papers for the time being on the Mac than deal with any of the ^X^Y^S.C.L style word processors they have used before, but they they are not hackers. They are of course hoping for even better software and sooner or later they will get it, but they are already satisfied and find the Mac a useful and important tool.

About Color:
There are two DIFFERENT color mechanisms according to my copy of Inside Macintosh. One is the one mentioned in a previous message which tells which of 32 bit planes in which to draw and is called by printing software for a color printer or other color imaging software.
The other color mechanism is accessed by routines that set the foreground and background color of the pen. Thus you CAN set it to red and draw a box and then to blue and draw a circle or some text. It is very clear that this second mechanism is for the screen so I think that we may very well see color eventually. They even have predefined constants for colors red, green, blue, cyan, magenta, yellow and of course black and white and carefully specify that if you write to the screen in any color other than white it uses black instead for present.

Chad

ReSent-To: info-mac: ;

I remember reading someplace that one of the major reasons Texas Instruments
failed with the 99/4 was that they "correctly concluded that the hobbiests
and hackers were a small part of their customer base, but incorrectly
concluded that therefore they were unimportant"

Perhaps Apple can survive with software from the big houses. But don't
forget, Apple, that the hackers (I use this term in the positive sense)
are the ones giving advice to others on what computer to buy. They also
run users groups, write books and magazines articles, and develop
much public domain software for free. Don't forget that it was software
availability that made the Apple II so popular-- and it wasn't 1-2-3
and Wordstar.

So what am I leading up to? Well, I love my Mac and I can't wait to program
it. First I find out that not only is MS-BASIC a dog, but I can only
use 10-15 percent of the memory. Than I hear that PASCAL is really only
meant for learning and is definately not for software development. FORTH
might be OK once the bugs are out, but you need a licence to distribute
software. So I rest my hopes on the assembler. But now I hear it
will take TWO MACS!!

Come on Apple. You designed a great machine. Don't blow it by playing
games with your best free advertizing media. I'm sure if you try
you can develop an assembler (or PASCAL compiler) that can run on one
MAC.

I had a problem with a destroyed disk too. At 1am one morning I was
playing with MacPaint, and decided to center the simple screen drawing
I had made on the page. I moved it with the show page option. Of course,
the mac then had to create a disk copy so it could page section in and out now.
Well, there wasn't enough room on my paint disk to do that, which it
promptly warned me of with the "Running out of room... OK" box. Sure, I said
ok, then saved. Disk overflowed. No sweat. Start the cycle over again..
"Running out of room...OK" "Yes, save on *another* disk.." (it saved great).
MacPaint then quietly stopped. I wanted to print it, so I checked my file
size. Yep, there was enough room to put the painting back on the macpaint
disk and print it. A few K left over too. I used the finder to copy it.
I then got into Macpaint. First thing it did was tell me the disk was "Running
out of room... OK"... Then promptly destroyed my disk with whatever it did
upon terminating. Got ID 13's when booting, and 2's when reading after booting
of another disk. Luckily after the 4 attempt I remembered Bruce's advice
about using Option-Command. (Course, I didn't remember which keys they were,
just had a hunch from the way the mac philosphy seemed to be going..)
I tried it, and got EVERYTHING back, minus the folders.. No Biggie, folders
are easy to make, especially since the Empty folder was there. I also
lost my Info boxes, which was slightly less nice, but recoverable with a little
searching of files. The only bad point about this (besides the fact it
shouldn't had happened) is that this is NOT DOCUMENTED! If I wasn't
reading this list, I would have basically lost a disk until I could find
a magnet to unformat it. It would have been nice to find this note on the
same sheet as the improved copying information was found! The systems
user friendly.. the documentation isn't..

        -Ron

Interesting little thing popped up while I was using MacWrite. I had a 5+

page document I had written to experiment with MacWrite. I added a header and a footer to the document, and printed it out. I went through each of the modes to check the differences. Draft mode is nice and fast, except for one minor problem.. With the header option on, the Mac writes them as seperate files. This is natural since it's 3 different windows and not just a "snapshot" of the file as in other modes. The Mac will meriily whip off a page, print the footer (in this case a page number and string of text) do a "formsuck", print any header text at the top of the page it just printed, line feed, think a moment, go back and print things like date time, formfeed, and start the cycle again for the next page... I think a little optimization is in order. I tried rearranging the windows to put header on top, but the Mac has it's own internal order it is concerned with. Amazing how much time 5 formsucks and 5 formfeeds add to the print time..

I was impressed with the Imagewriters ability to actually *do* a formsuck. Most single tractor printers can't easily. According to the manual there is a wealth of things the beastie can do. It also seems too have prodigious print buffer.

        -Ron

There seems to be some sort of asymmetry in the ellipse drawer. From within MacPaint, set the black pattern and toggle into FatBits mode. Draw 3x5 pixel and 5x3 pixel filled ellipses. One will be a rectangle and the other will have corners chopped. The effect is most noticeable when drawing long narrow (3 pixels) horizontal ellipses.

CMU now has a Mac user's group. Here's a post made on our local Macintosh bboard:

If any of you out there need support for your Macs, the CMU Macintosh Users Group can help. We are an established group (well, three months at least) and will be gettting all sorts of goodies (software, mainly) starting next semester. Our next meeting is next semester. Write for details.

Scott MacPherson
(sm1p@cmu-cc-td)

Anybody else have a user's group? Maybe we can exchange newsletters or something...

- Walter Smith (wrs@cmu-cs-spice.arpa)

MacPaint has trouble handling text running off the right side of the screen. For instance, select 18 pt. Athens underline & outline; now hold down shift-option-' (upper left key). Those adorable pawprints lead to a ferocious system error (ID=28).

The Boston Computer Society has a new Mac user group. It meets on the second Wednesday of each month. Upcoming mtg. May 9 at Mass. College of Art, Tower Auditorium, 721 Huntington Ave., Boston (2 blocks past MFA). Time: 7:30 pm.

While the two Mac arrangement will be indispensible to DEVELOPERS
who want full control of the screen for their software products, for
TEACHING purposes, the MacAssembler is probably not the right thing.
When programming in assembly language it is so easy to screw oneself
that for students first learning about how machines work inside, a
constrained environment like MacPascal is much preferable.

It looks like there is a need for a EDUCATIONAL PRODUCT here folks!
How about a 68000 assembler and a very "careful" stepper/debugger
that provides extensive error checking and displays the state of
the registers and relevant segments of memory while the program is
running? How about providing a "dial" that you can turn to slow
your program down to a comfortable crawl if things are happening
too quickly?

Remember the days when computers had blinking lights, and you could
tell what your program was doing just by gazing at the dancing patterns,
or by sticking an FM radio next to the processor and listening to the
buzzing and humming? Well, times haven't changed that much, we just
have "bitmapped displays" instead of "front panels" and "sound
generator chips" instead of transistor radios, that's all...

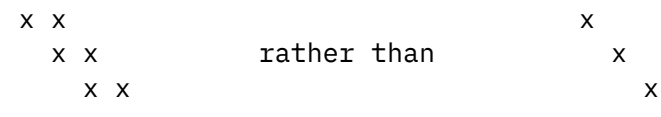
The Quickdraw bug in ellipses you mentioned isn't the only one: long skinny ellipses have points missing. Also, the 45-degree portions of circles are like



which some might consider a bug, others a feature.

Is there any way to print the Notepad? I haven't found one (short of putting it in a MacWrite document...) Sure would be nice, e.g. so I don't have to lug my Mac with me to the grocery store. Should use draft mode.

Also, selection extension (with shift-click) works differently in MacWrite and Notepad; in particular shift-clicks before the beginning of the original selection point behave differently. Consider a line a....b....c. Click at b, shift-click c, selection is from b to c. Now shift-click a; in MacWrite, selection is from a to b; in Notepad from a to c. Tsk-tsk.

After the Finder repairs your disk, it is confused about where the icons go in the disk window. In particular, if you select "clean up" the icons get bumped up to the very top of the window, instead of leaving a little border. Rebooting takes care of the problem.

This occurred under the following circumstances: after working with the Mac for a while I began to notice that the Finder was taking a LONG time to start up after an application quit (it seemed to be going back and forth between two tracks several times), and that MacWrite documents (both existing and newly created ones) were being shown with a plain document icon (not the document with lines of text). Then after doing some folder rearranging, the Finder said there wasn't enough room on the disk to store the changes (even though the disk window said 32k). I rebooted (I think), and the Finder repaired the disk, which cured everything--except the icons were put in the wrong place by "clean up", and rebooting again solved that.

ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

I want to drive a Hewlett-Packard 7470A Graphics Plotter that has an RS-232 interface from the Mac running either Microsoft Basic or MacBasic, and would appreciate information on what handshaking support is available from the RS-232 port on the Mac when using either of these programs.

The hp 7470A thinks it's a terminal, and I appreciate that a null modem cable which interchanges pins 2 and 3 between Mac and the plotter will probably be required. However, the plotter can then be set to do either hardwire handshaking via pin 20 (DTR), if the computer it's talking to monitors that signal; or Xon-Xoff handshaking.

After a certain amount of grief in attempting to interface this plotter to a TRS-80 Model 100, I found that the Model 100 does not monitor the hardwire handshake when running Basic (though you can PEEK

at that pin and monitor it yourself, if you want to); but the Xon-Xoff protocol does work automatically, if you OPEN the comm line right.

     Can anyone tell me what I'll encounter with the Mac?

I've heard reports that the University of California was negotiating as a whole with Apple either for membership in the Apple Consortium or for some sort of discount on purchases of MacIntoshes. When I first heard this report, a month or two ago, the agreement was supposed to be "very close." However, I've not heard anything since then.

If someone knows about the status of any U.C./Apple agreements, I'd appreciate it if they could contact me with the current information.

Thanks very much.

I'm running 2.0 on a Lisa 2/5 and have suddenly started getting
a rash of "...technical difficulties...system will restart" messages
when opening up a document or starting a backup operation. In every
case the message number is 1033/21/n, where n=2759360 when I'm opening
a LisaTerminal, LisaWrite, or LisaCalc document. For other operations,
n is some other large number (looks like a disk address?).   The problem
is intermittent.

I called the Apple "support" hot line, only to be told that the error
usually occurs when pasting from Term to Write -- I've encountered that
bug, and it's not the cause of my current problem. The person at Apple
claimed that the value for n probably came from a line number and that
the numbers were *undocumented* -- no-one there could tell me what they
meant. Ridiculous.

Can anyone out there tell me what the numbers mean? I'm reluctant to
just reinstall the system and repair the disk since the last two times I've
done the repair the system trashed some crucial directory files and cost
me several days work (Apple tells me that this problem is also known to
occur but the they don't understand it yet!).

Subject: Mactep for 7 bit, even parity
ReSent-date: Mon 7 May 84 21:32:26-PDT
ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

About 10 years ago, the data communications people at the Los Alamos (then Scientific, now National) Laboratory decided to use parity on asynchronous lines, and even parity at that. It may have had to do with the default configuration of Texas Instruments "silent 700" terminals, or someone may have thought that bad lines could be determined by noticing high error rates (they never had time to seriously monitor lines no one was complaining about, because were complaining about so many other lines). But 7 bit, even parity, seems to be here to stay .. so ..Mactep does nothing about character length or parity in the "SCC," the Zilog or AMD 8530 chip in the Macintosh, and Mactep as sent over "info-mac" will not work on the Integrated Computer Network at the Los Alamos National Laboratory.

I made some changes to Mactep so that it will work, and ran into enough problems that I think sharing the changes will save others a few hours, in the unlikely event their computer cares about parity.

The main problem I had was guessing the bits to set in the 8530 write registers 3, 4, and 5. Particularly the D5 and D4 bits of WR4. One would think that the sync character length would make no difference when one is in asynchronous mode, but the changes didn't work until I set both of these bits, which is the code the table calls "external sync mode."

It would have been so much easier if one could read these control registers, but I suppose it is already difficult to put the functions the 8530 has on a single chip.

I also noticed that Motorola data sheets for the 68000 include assembler mnemonics for the instructions, but not the bit patterns in the instructions! I guess these sheets are still preliminary, or the Motorola technical writers could never figure out how to document the bit patterns. The 68120 has a very nice description, though.

The mods I made follow -- one note is that I think odd parity, 7 bit characters can be selected by making the 77 in 9154 a 75.

```
9151 INPUT "7 bit even (Y/N)", BSC$
9152 IF BSC$<>"Y" AND BSC$<>"y" THEN GOTO 9157
9153 R=3:X=&H41:WXCCB!=VARPTR(ML(0)):CALL WSCCB!(R,X)
9154 R=4:X=&H77:WSCCB!=VARPTR(ML(0)):CALL WSCCB!(R,X)
9155 R=5:X=&HAA:WSCCB!=VARPTR(ML(0)):CALL WSCCB!(R,X)
9156 GOTO 9160
9157 R=3:X=&HC1:WSCCB!=VARPTR(ML(0)):CALL WSCCB!(R,X)
9158 R=4:X=&H74:WSCCB!=VARPTR(ML(0)):CALL WSCCB!(R,X)
9159 R=5:X=&HEA:WSCCB!=VARPTR(ML(0)):CALL WSCCB!(R,X)
```

Thank you for the time you have spent answering questions, taking bug reports, and playing go-between for Apple, but since it not your job, there should really be an "official" Apple mailbox and a person whose job it is to monitor this list and pass on useful info when possible. I noticed that you often forward mail from Apple people. This service has also been much appreciated, but shouldn't there be a way for them to "speak for themselves"?

I am not proposing that Apple start giving away lots of free technical advice, but this list has potential for providing a wonderful two-way exchange medium between Apple and a lot of very bright MacHackers ("hacker" in the positive sense, of course).

Subject: Interfacing other disk to a mac
To: info-mac@SUMEX-AIM.ARPA
ReSent-date: Mon 7 May 84 21:32:24-PDT
ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

I just attended a Mac developer's seminar put on here by Andy Hertzfeld of Apple. I (think?) that these are being put on for the various consortium schools (has anyone else been to one?)

It was very worthwhile, as much for "fokelore" as for hard information; if you're offered the chance to attend, I'd recommend it.

Anyway, one of the most interesting aspects was gaining an appreciation of the entire driver/file system structure, and how the design makes interfacing other disks or file servers easy.

Basically, as I understood it, both the generic disk driver and file system driver, in addition to their normal (Apple supplied) routines have "exits" built-in, at appropriate places, for other (non-Apple supplied) versions of the routines for non-Apple disks. It's designed in such a way that the disk can either be "dumb" (analogous to the existing floppy) where the disk can only return sectors, or "smart" in the sense that the disk is really a "file server" which is passed file names and logical read/write requests in which case the Mac doesn't do directory processing locally. Apple's assumption for "big" hard disks is that they will be of the "smart" variety. For the Sony floppy, the Mac caches the entire directory in memory, since the memory requirements are nominal (they stated about 300 bytes). However, for a large hard disk sitting on one of the 422 ports, the assumption is that it is of the "smart" variety which is passed logical requests so that the Mac doesn't need to process locally the directory information.

What is interesting about this approach is that it would seem to make using "big" host computers as file servers a relatively easy task, although admittedly you'd be constrained by typical serial line rates of the host (e.g., 19.2 Kbit/sec) - the problem is the typical hosts - vaxen, 20s, etc. - not the Mac. However, for bulk file storage this may not be as serious a problem. What's fantastic about this approach is that above the level of the file system such a server looks identically to a local disk; files on the host server appear as icons, and the host appears as just another disk.

The seminar didn't go into any more details. However, I intend to follow up this information and see where it leads. It was clear from the presentation that Apple gave a great deal of thought about handling a wide variety of disks and file servers cleanly and uniformly, and that someone interfacing a "brand x" disk is definitely not at a disadvantage to Apple in terms of interfacing cleanly and uniformly to the Mac os.

Fascin ating, iosn't it. Two of my shills, both highly wualified programmer types, have been rejected as developers. Except for BIG BUSINESS types who get along nicely with the new Apple Image, exactly who HAS BEEN ACCEPTED as a Developer? What are teh criteria? Or is this another -- well, there are terms for it.

TI told hobbyistsz and hackers to drop dead, twice.

Grrrrrrrreat Idea!

I really like the idea of using the sound capabilities
to work the way FM radio near the processor does! I have
written several compositions that involve FM radio & CPU.
I'm going to look back to that stuff and see how I worked
it...

Who knows... Sound Debugging (all puns intended) I Like That!

Jerry, you're at it again. Because two "of my shills, both highly
qualified programmer types, have been rejected as developers" you
infer that "BIG BUSINESS types who get along nicely with the new Apple
Image" are the main accepted developers. Cowdoody. I have a
consulting firm of two, including myself. We are not only certified,

but also registered developers (direct access to Apple, electronic mail account, etc.) How did we do it. Simple. We have a product already in existence which has been sold to several buyers of substance, and runs on an existing (IBM PC) machine, and we can prove it to Apple. We have NO image, just product. Nobody ever heard of us except our customers and others in our professional field (economics). We didn't know anybody at Apple nor did we meet anyone there prior to becoming registered developers. We have no vast corporate or financial resources. We're just legitimate developers. But I'll bet Apple is flooded by applications from programmers who say they are developers yet have not got any legitimate product out there. Everyone would LOVE to get the developer discount on hardware and software but only actual developers do. What about 'new' developers who have not yet produced and sold product? I guess they first have to create at least one product and market it successfully before Apple will accept them. Same in your profession. You can say you're a writer all you want but until you've had something published, I'll believe you're a writer; your mother will believe you're a writer, but writers? Isn't it about time you got off your (sometimes virulent) anti-Apple prejudice and took facts for what they were, assuming a legitimate explanation rather than base motives unless and until proven otherwise? --david--

I have a question from off the net:

> "I want to use MacPaint to draw pictures that are wider than they are tall [landscape instead of the usual portrait]. I know I can rotate lassoed portions of a picture, but any such rotated portion of the picture that falls outside the window gets lost. (Basically, I want to turn my piece of paper sideways). Anyone know how to do this?"

Thanks!
-Mike <mab@AIDS-UNIX>

Let us remember what the certified developer program is all about. If one is accepted as a certified developer, one can get hardware at a discount. Period. Without certified developer status, one can still buy Macs and Lisas, and can get Inside Macintosh and all necessary tools. There is a special developer status (something like "registered" I think) which allows you to use electronic mail, etc. for help but that costs and I doubt that many "hackers" would be interested.

Apple seems to have a simple formula for accepting certified developers. If it seems that a person/company is likely to use the machines purchased to develop software which will sell or otherwise have wide distribution on the Mac then they qualify. If it seems that the Certified Developer status is going to be used simply to buy cheap machines for personal use, then why should they qualify? The application of this test seems to also follow a simple formula. If you have a company (size >=1) which has developed and marketed any software then you probably qualify. If you have a company (size >=1) which has a plan for some interesting software and some kind of development schedule then you p[robably qualify. If you are an individual with similar qualifications then you probably qualify although not quite as easily.

I assume that you don't expect Apple to just give away certified developer status to anyone who wants to buy a machine. That would be equivalent to just placing all hardware on a massive discount (which while we would all like would be improbable as long as they continue to sell every Mac they make as fast as they can ship it).

EVERY person I know who
    1) Has a company name and has developed and sold software
or 2) Demonstrated to Apple that he/she was a very competent
       programmer with plans for a real product
has been granted certified developer status upon applying. Those who have demonstrated competency but had no plans have not been accepted (at least on the first try). Of course if you buy some hardware and start putting a product together and then apply you will probably get accepted with flying colors...
                            Chad

In response to the messages about color, what I've heard was from John Sculley (President of Apple). He held an informational meeting here at Brown, and said that there will indeed be a Color-Mac eventually, but to have made the original Mac color would have meant a release date substantially later than when it was released. He said that eventually there will indeed be a Color-Mac.

Atkinson's DEBUGGER:
   It appears that Bill Atkinson left a debugger in MacPaint. It was found in version 0.95, though it may be in all versions. It was found twice by screwing around with the keyboard while in MacPaint, but can't be found again. Anyone with any information about it? What I know is this: While 'A' was selected (for text), and Command-Q was chosen a new menu bar appeared with the title DEBUG, and if it was pulled down, three selections appeared: HEAP, WORST STACK, and MONKEY TRAP. Certain keyboard commands did things also. I am obviously missing steps, in that it can't be reproduced. Any help would be appreciated.
                              -Mike Russell (G.BROWNVM=UN502080@BERKELEY)

This is totally in line with what Apple told us at the recent developers/ consortium meeting. They currently have over 1000 registered developers, and, in order to be able to handle the crowd, have tentatively put a hold on accepting new developers EXCEPT those w/ proven records in developing software. This makes emminent sense to me: everyone and his aunt and uncle seems to want to become a Mac developer. Apple has a choice in diluting the amount of support given to developers by allowing an uncontrolled number of them, or can attempt to qualify developers and provide a higher level of support. It seems that if Apple is interested in seeing software out quickly for the Mac (which certain people such as Mr. Pournelle seem to regularly complain isn't happening fast enough), what they're doing is exactly on target. The last thing that Apple needs to do is waste effort on every random who has a half assed idea for Mac software.

The reality of this world is that, especially if the goal is getting software out there quickly, that putting your eggs in the basket of established developers will probably win. This may unfortunately mean that some good new ideas get lost (or more probably delayed). However, the Mac will make it commerically during the next 6 months largely on the basis of the popular existing packages being ported to the Mac. From that perspective what Apple is doing is totally correct.

Yes, my sentiments. I joined this list a bit late, and I wondered if there had been an ongoing poll. I know one designer from Ithaca who's been certified for 1+ years, and one Palo Alto insider. But I know various people who've been ignored or rejected. Is this temporary or is it a policy?

West coast friends have claimed instant receipt of development tools, even without a business plan. The Apple people seem to know that widespread support for developers is crucial, so they encourage their friends. But some proven east coast software companies have slipped between the cracks, because they've never met an Apple person.

Is this just early disorganization, or is it understood that the cost of providing documentation and updates widely is too high? That would seem short sighted.

virulent cow pucky. I don't care a tinkers' damn for or against Apple or any other company. I do care that claims have some basis in reality; that claims to reverence by the hobbyist commuknity be based on something substantial; that claims to some special status have some basis.

If IBM had brought out a limited memory, small screen, single drive system with proprietary operating system, charged $150 for the system documents needed to do anything particularly useful with it, helped people put out a bunch of $14.95 to $19.95 books that contain almost no real information (but were almost certainly supported by early copies of and access to the machines prior to the rest of the world getting them): whould IBM have been proclaimed Good Guys?

I completely agree: the Mac is fun. For a student with $1000 it's probably a darned good buy for playing about with doing homework, writing letters, etc. You will still need a real calculator for your desk since the Mac one doesn't even have elementary functions; you'll have to wait if you want to

load up basic and use that; you will have to find a printer if you want to turn in the homework; but it's a nice buy.

For "the rest of us" who don't know much about cmputers and have been waiting to get one until something very useful and easy to use came out, I might have a different recommendation at $3500 (by the time you get a useful configuration).

It was not me who put forth the Macintosh as the solution to all the world's computer problems. On the other hand, i have a strong interest in seeing people happy with their machines; and while I have heard a great deal of praise from computer scientists who see the potential and like the DIRECTION the machine seems to point to, and a lesser amount from new users who are very pleased to poke around and find the fish and the frog and other pictures and play with fonts, I do not hear such hjappy noises from "the rest of us."

It was not me who claimed there would be enormous piles of software by April.

As to the "Developer" status, I hardly care; but again there were these exhortations given at shows and prior to the release of the machine, and lots of talk about it. People were encouraged to apply; later, they find, they should not have been. Okay by me.

I would myself thnk that if Apple sold Macintoshes to every random Ph.D. who wanted to get one as a developer (and who had already persuaded the company he consults for to buy a Lisa for his project) then, given that they do not lose money on the discounted price anyway, they probably wouldn't go broke; and they might get themselves a few people out there who can deliver some software.

Availability of applications software is going to make or break the machine; I cannot thnk that long delays in processing "developer applications" followed by turndowns is going to get the hobbyists and hackers writing up a storm.

Sure: Apple will lose a little money to people just trying to get machines cheap; but it only takes one VisiCalc to make a product successful. At the moment that applications program has yet to be written.

Maybe, just maybe, something else will catch up faster than Apple suspects.

I just came from an informational meeting put on by the Stanford people who coordinate the Mac purchasing/support at Stanford. They announced that they have been talking to the Graduate Program Office about ImageWriter output, asking whether it would be acceptable for dissertations. The response was a definitive maybe. The people at GPO did not say no, but they were not terribly pleased with the output. It sounds like they will accept it if everything else is perfect.

The people at GPO said they liked New York and Geneva 9 point fonts best. They also liked New York 12 point font, but not as much. They haven't seen 10 point output, though. It was also reported that a new ribbon does not produce best results (characters look filled in). They suggest a medium-worn ribbon (after, say, 100 pages of output).

Tips on how to open the thing up:
    Make sure the Torx T-15 screwdriver you get has an extra long shaft (>= 5 inches, the usual ones are only 3-4 inches). This is needed to reach the two screws way back under the handle. Alternatively you can get a Torx bit on a 1/4" drive socket and use an extender, or buy a normal Torx driver and cut the handle down.
    There is NO screw behind the Apple decal! That is a myth, like the one about the left-hand-threaded light bulbs on New York subways. There are only five screws: two near the bottom (marked with ! icon), one in the battery compartment, and two under the handle. When you remove all five screws the case still won't come off, because it's fitted very tightly. Pry it open with something blunt, like a butter knife.
    If you have the programmer's switch installed, it will tend to hang up on the aluminum-foil shielding behind the I/O ports. Be careful.
    On the video board (left side) there are adjustments for picture width and height. If your Mac has very wide margins, you can make the picture bigger. Just be sure you keep the aspect ratio square -- while doing the adjusting, have MacPaint running with a large square drawn on the screen, and use a ruler.

Random observations on the interior design:
    The frame is still designed for the 5.25" Twiggy drive -- they mounted the 3.5" drive on a Twiggy-sized bracket so it would reach the screw holes.
    The case is nice heavy stuff, with a thick coating of conductive paint on the inside, almost obscuring the signatures of all the designers (that's NOT a myth!).
    As all the phantom drawings suggest, the right side of the case is almost empty. Enough room for a memory board or even a second disk drive. Probably not enough for a Winchester, though.

Subject: MacTerminal bugs?
ReSent-date: Thu 10 May 84 17:16:33-PDT
ReSent-From: Ed Pattermann <PATTERMANN@SUMEX-AIM.ARPA>
ReSent-To: info-mac: ;

I've been using MacTerminal (alpha minus something), and have a couple of questions... First, previous mailings to this list have indicated support for insert character. What is the escape sequence for this... the vt200 escape sequence of

     <ESC> [<n> @

almost works, but not quite.

Second, how is the file transfer stuff supposed to work? In fact, does it work?

Third, there seems to be a very minor bug in the cursor control. If you do something in a dialog box, then there is a chance that MacTerminal will leave a stray cursor in its current position. As near as I can figure, you pull down a menu when the cursor is either on or off, this stops it from blinking. Then when you are done with the dialog box, the program is confused as to whether the cursor is really on or off. Assuming that the cursor is drawn using an XOR operation, it can potentially leave the character inverted.

Avie

Fairly easy software hack: a printer driver called by the vertical blanking interrupt, so you could compute while printing? Only problem is it would periodically have to read more data off disk, and I don't know if interrupt routines are allowed to do that.

All the documents say the mouse is handled at such a low level that there's just no way to move the cursor somewhere else or even confine it to a particular area. Now, I can't really believe that, since the mouse just outputs a pulse for every 1/90 inch of vertical or horizontal movement, and anyhow the cursor is obviously confined to the limits of the screen. Perhaps the cursor is a sprite and handled entirely by the video interface, but that seems real unlikely. Now it may be that the mouse handler is entirely in ROM, with no trap vector so it can be overridden like the Quickdraw routines. However, the current mouse position is certainly not in ROM, so there has to be an appropriate magical POKE that will do the job....?

Now that the Apple IIC ("Apple II, crushed") is out, will the FlatMac be far behind? Well, it will have to wait for a 512x342 liquid-crystal display because there's no way the Mac can output to a TV set or even a standard monitor (it doesn't use ordinary video signals). Apple is having enough trouble getting Sharp to make a 560x192 LCD for the IIC -- all they want to build are 640x200 displays for IBM-PC's and clones. Figure about 18-24 months for LCD production to catch up enough that odd sizes can be ordered. BTW, does

anybody know how thick the IIC's LCD is going to be? All the magazine photos show a 3/4 front view with the unit tilted up, so the back might be anywhere from flat to pyramid-shaped.

Since the Mac CPU board is just under 9x9 inches (and contains the entire workings of the machine except for the power supply and video electronics), it would fit in the same size case as the IIC. The disk drive is about 3/4" thicker, so the case would have a bulge in back. However, the drive is also narrower, which would leave about two inches of space behind the keyboard -- just right for a trackball, and perhaps a small nicad battery pack (that room might be needed for a board to control the LCD).

Thoughts on the next machine in the Apple 32 line: The Mac is a neat architecture except for lack of virtual memory, but it's I/O-bound. The floppy is none too fast, and the IWM disk controller grabs the entire CPU during disk operations, which is nasty if you want to do serious multitasking. A Winchester can theoretically transfer data at 500Kbytes/sec, five times faster than the serial port can theoretically receive it. Now if the disks were only memory-mapped like the video, stealing half the memory cycles, they would be capable of at least the same transfer rate as the video -- 22Kbytes every 1/60 second, or 1200 Kbytes/sec! Well, this could be done by turning off the screen during disk I/O, but that would be even uglier than turning off interrupts. Hmmm.... the video DMA uses only one fixed piece of memory, near the low end. If the machine has at least two ranks of memory chips (256Kbytes of 64K chips, or 1Mbyte of 256K chips), the memory bus could be cut in half during the memory cycles reserved for DMA. Then while the video hardware was reading the low bank of memory, the disks (or any other devices) could be reading and writing their buffers in high memory. Some more complex disk controller than the bare IWM would be needed, equivalent to an ordinary S-100 or Multibus DMA disk controller. Perhaps the IWM could be operated by another custom chip or just some PAL's and shift registers.

Another useful addition might be a smarter video controller, one that could handle multiple bit planes and put them in arbitrary places on the screen (basically giant sprites). This would be nice for windows, but great for animation. Oops, if the bit planes are transparent and you have N of them at one point on the screen, that means N memory accesses per pixel time. On the other hand, most of them probably wouldn't be transparent, and even one extra bit plane would help a lot.

I'm rather perturbed by the fact that with both MacPaint and MacWrite, what you see is often NOT what you get. Some examples:

MacPaint: Every 10th raster line is deleted when an image is printed (always!). The reason for doing this is fairly straightforward -- the printer prints only 72 dpi vertically, but 80 dpi horizontally, while the screen is 80 dpi in both directions. In order to preserve the aspect ratio and the size of the displayed image, every 10th raster line is just left out when printing. Unfortunately, this is rather noticable: text gets scrunched; shaded areas become streaked. If you don't believe me, simply print the current window while in MacPaint and see what happens to the parallel lines in the window's title bar. Possible fix: add an option that prints images 72 dpi horizontally and vertically. This would make the printed version larger than the displayed version, but at least they would have the same appearance.

MacWrite: The problem is that right justified text often isn't. Some characters seem to have too much padding on the right side ("y", "r"), so that if a line ends with one of these characters, it isn't quite flush. Much worse are "l"'s: a line ending with "illegal" or "all wall" will really stick out past the right margin (when printed, not when displayed).

Another way get text to stick way out into the right margin is to end a line with something in italics (or even better, bold italics). The slant will slant right into tomorrow. When I went to the end of the line and tried to add some extra spaces so that the text would get shoved left a bit it moved FARTHER TO THE RIGHT!

I encountered these problems when working with a very narrow document (2 3/8 inches) in 9 point Geneva. I don't know if they occur in other fonts or sizes, but I rather expect that some of them do.

Warning: long flame (~==========)

It's been interesting watching the discussion on the net. From what I can see, the people posting on this net fall into three groups:

(a) Certified/registered developers who can afford to buy Lisas and expensive documentation, and who generally defend every move that Apple makes,

(b) Hackers, students, etc. (like myself) who see the potential in the machine and will occasionally acknowledge the warts, but do not have money to spend on Lisas to go with our Macs, and

(c) People who have used computers, but have not used computers that have mice and windows (I suspect that Jerry Pournelle fell into this group until his Lilith machine arrived).

As someone else noted earlier, one problem with the Macintosh is that it tends to overload the mouse. The computer that I work on (a Perq running Accent) tends to use the mouse only where it actually provides an advantage.

The editor, although non-programmable, has the usual set of Emacs-like commands, given from the keyboard. In addition you can use the mouse to move anywhere in the file quickly and to select blocks of text that will be copied or deleted. If you absolutely hate mice, there are alternate keyboard commands that accomplish the same effect (more slowly). I tend to use the keyboard when entering new text and a combination of keyboard and mouse commands when editing an existing file.

People in group (c), though, are likely to take a look at the Macintosh and conclude that its faults are characteristic of all systems with mice and bit-mapped displays. Without a standard of comparison, they are not likely to see the machine's potential (software tends towards the lowest common denominator and the Mac hardware provides a fairly high "standard" with the exception of memory size).

Of course, the machine's potential is not likely to be realized unless the people in group (b) can easily write software for it. Randy Frank is just plain wrong when he says that the best way to get software for the machine is to limit support to a few "proven developers." The history of the Apple II family should prove otherwise. (Oh, by the way, wasn't the Apple II designed in a garage and Visicalc written by a couple of college students? How many Apple IIs were sold because of Visicalc? Why is the Apple II still selling after all this time? No, it couldn't possibly be the thousands of peons who have written software for it. . . Why is the TI 99/4 dead? Could it possibly have something to do with TI's attempts to prevent hobbyists and hackers from getting inside the machine, especially during the first part of its life?)

Way to go, Jerry. I may disagree quite violently with you on many points, but you are absolutely right in this case.

Is the MAC dependent on the mains frequency in any way?
I want to bring mine over to Europe where 50 Hz is what comes out of the plug. I guess that the real-time clock would be something you often control by the mains. I'm not worried about the video frame rate, since switchable terminals are always run at 60 Hz rate anyway in order to minimze the flicker, and that works fine.

I suppose that the voltage will be the problem, since the supply is probably not switchable to 220 V. (At least it wasn't on Apple II)

1-The categorization of people reading the BBoard is a real overgeneralizaton. For example, I am a certified developer. I am also a graduate student and cannot afford a Lisa. I have some things I am putting together with one other person. Since they would need to be coded in assembly anyway (the Mac is the slowest machine they could possibly run on) we will be using the assembler when it arrives. Meanwhile we are doing the product design.

I have no other direct connection with Apple. I have friends who work there and at HP, IBM, etc. Some of my school research is paid for by IBM. And I have worked for Bell Labs. Almost three years ago I specified the personal computer which I would be willing to buy and which would be interesting for me to program. At the time there was nothing anywhere near the price range. The Lisa was impressive and if it had been cheaper or earlier would have been a hit. I know several people who bought IBM PC-XTs prior to January 24th who wish they had waited for the $5500 Lisa 2/10 (much cheaper than about $7000 for a "somewhat similarly equiped" PC XT).

The Macintosh is very close in all respects including price to the dream machine that I specified. It is powerful enough to do interesting work and to make an attempt at enogh user friendliness to call it an appliance. I am looking forward to being able to program on top of an existing user interface which is not upward compatible with punched cards.

I find it hard to believe that anyone could fall for the statement that if IBM had come out with this machine we would all be complaining. If IBM had come out with this machine, Apple would have lost totally. We would all be shocked at something so innovative (IBM does innovative research, but it is a real surprise when they come out with innovative products since they have a stated policy of letting other companies do their market research for them).

Apple isn't perfect (and I admit that there may be people on this BBoard that seem to doubt it). The Mac has some flaws. SOME of the software is coming late. On the other hand, the software is no later than it has been for everything else I have ever dealt with, it is far more powerful and complex software than has been on personal computers before, and Second Quarter does not mean April; it means before June 30. I know of no other machine in the price range that comes close in almost any measure I care about. It is not a Dorado, nor a Lilth, but then it does not cost $100,000 nor even $10,000.

Thus, you see, I am not a rich Lisa buyer, but I like the Mac a lot. It brings computing to my parents (who bought one), my brother (who bought one), my wife (who tells me we need two). None of them has ever written a program.

All of them had access to IBM PCs and used them for word processing and accounting. None of them liked using the PC and they still had negative feelings toward computers in general. They each spent a few hours using a Macintosh and decided that they wanted one. They now feel confortable about computers. Computers are acceptable topics of conversation. My wife is planning to computerize her files, her recipes, our library, etc. She could have done that before on other machines, but she never felt the desire to and never really felt comfortable with a computer before, despite my prompting for several years.

Macintosh does something which may seem terrible to some. It makes computing fun. I admit that to some it may have been fun before Macintosh (myself included), but then some people thought it was lots of fun to enter in long sequences of machine code using front panel switches.

2-I have been asked by a friend (Robert Gardner) to forward this to the BBoard:

I have been trying to understand why some people are claiming the Macintosh is overpriced. A look through the What's New column of the most recent BYTE shows, for instance, the Zenith Z-100 PC compatible with 128K bytes RAM, 2 serial ports, graphics, and one DS/DD drive lists at $2800; the new PC portable (if you can call 30 pounds portable) with 256K RAM and 1 DS/DD drive (but minus everything else IBM PC's are famous for coming without) lists at $2800 also. These machines come only with system software, don't include a mouse or graphics in ROM, windowing, etc., and are bogged down by a barely adequate CPU. A look through the mail-order discount houses also shows the Mac is at least competitively priced.

So, I wonder, the Mac is overpriced compared to what? It's more expensive than the Kaypro or the myriad of other 8-bit machines, but certainly a 16/32 bit machine can't compare in price with an 8-bit machine (unless we're comparing price/performance). I think the answer is that the Mac is overpriced compared to expectations, and perhaps Apple is guilty of raising false expectations (I guess Scully is to blame for shattering those expectations).

Finally, while we all would certainly like to see the Mac cheaper (and everything else we purchase, too!), we need to remember that this country is built on the profit motive. According to Adam Smith, when demand exceeds supply prices remain high. Currently, Apple is able to sell more Macintoshes than it can build, so the price is justifyably high. Rumor has it that it costs Apple around $600 to build a Mac (I assume this includes parts and labor only), so we can surely expect the price to fall once their production facilities are able to keep up with demand. In the meantime, I don't think we can begrudge Apple their well-deserved profits.

Re: MAC in Europe
Date: 11 May 1984 07:51:50 Z
Text: 50 Hz is no problem. We have used the American version of Mac with a small transformer. The transformers are readily available over here. A 220/110 switch would indeed complement the Mac travel bag. Better yet, automatic voltage sensing and operation on various power standards would make Mac more "international" and less vulnerable to accidental smoke tests.

TV news this evening reports that Apple has sold 70,000 MacIntoshes since their introduction. The report is that this makes it the fastest selling Personal Computer in history. Does anyone have any details on this---how much of this is Consortium business, how long are waits these days for Consortium and private business deliveries, at what kind of rate is Apple now manufacturing them, etc.

Thanks for any information.

We asked Apple about that since many of our users asked the same
question at a Mac demo we put on here last month. Apple told us (and
it came out in print in the next Consortium newsletter that all that is
needed is a good quality voltage converter since 50 Hz is still within
the Mac's operating range. They don't use the line frequency for any
kind of clock.

I'm sending this message to the above distribution because I think that
some one in this group will be able to answer my question.

I will be purchasing a MacIntosh(with an Apple 1200 modem) in the near

future. I would like to know if there is, or will be (in the near future), any way that an individual, with out a lot of money or hardware , can use the MacIntosh to access the ARPA network or UUCP? Ideally, one would be able to do this without using the resources of their employer who may be part of the network. I feel that the potential that Mac has for this application is one of it's great strengths.

I am a physical scientist, not a CS expert. So, I would appreciate answers/solutions to my question that are understandable to one without intimate knowledge of Mac's(or any computer's) inner workings. I would also encourage individuals at Apple to respond. Of course, a ready made software package (reasonably priced) would be the most palatable solution for me.

Thanks for your help.

Myron Cagan

Subject: Macwrite pains

I am writing this note in the hopes that some problems I encountered using Macwrite can either be fixed in the next release.

I have a document that is big enough to take 100 percent of the Macwrite buffer space. I could deal with the following annoying little problems by working around them :

    There had to be *lots* of free space on my diskette before the save imagee for the printer would fit. This meant a diskette with Write, System, my document, and nothing else. The whole document image does not necessarily have to be created in one huge file!

    I had to save my file and bring in a fresh copy of Macwrite every time I got the message "Almost out of memory cannot undo this operation." while inserting text. Insert stops working when it

cannot undo typing. I expected tht later inserts would succeed after acnowledging that they could not be able to be undone, or that deleting characters from the buffer would help. This error also seemed to affect the other commands in random ways.

Bill Coderre is right about headers and footers being buggy. They have many problems:

They are awful to use. Their user interface should be re-thought. I suggest that headers and footers have commands to make them appear in the document, and seperate commands to grab hold of them for editing. In my large document, most of my fiddling time was spent waiting for Macwrite to re-paginate my document between hides and shows of my headers and footers. (I hope to hide and show less often when other bugs are fixed. see below)

Once the page number icon dissapeared from the footer command completely. I have not been able to re-produce this problem. I got around it by hiding the footer, saving the file, starting a new Macwrite and re-creating the footer.

The following happened with a particular very large document:

After certain screen refresh opertions, such as using the scroll boxes, or across a show/hide rulers command pair. The page numbers I asked for in my footer would no longer appear on the screen image. MacWrite had re-positioned the icon within the footer, and decided that even though the page number was still in a visible region of the footer, that the text should not appear. I got around this by I had to hide and re-show my footer, and move the page number icon to the second line of the footer from the first line of the footer (where Macwrite decided it belonged).

The first time I printed out my document, the header text, consisting of the date did not appear on the printed page. Only blank lines.

I made a few revisions to the text (deleting a couple of lines) and then neither the header nor the footer text appeared. I got blank lines where dates and page numbers should be. I suspected that asking for a big document with headers and footers was too much, so I got rid of the header. I tried reading the document back in to a virginal Macwrite. I tried several combinations of header text, lack of header text, etc. I could get the page numbers to appear in the screen image but never on the printed one!

After several hours of fiddling, I went back to a previously saved copy of the file that predated the problem with insertion, forgot about trying to get a header at all, (since it did not want to print), and settled for page numbers that printed. I also deleted MacPaint from the disk, because this time, although the document was 10 lines shorter, Write complained of insufficient space on the disk for the printed output. Booting a new MacWrite did not help at all,

althought I expected that it would. I suspect two possible causes:
 1) Perhaps header information stored in the document had gotten corrupted, and only a previous version of the document with correct footer information would solve the problem. I would have expected header and footer information to be completely replacable with new information from MacWrite rather than getting corrupted once and forever.
  2) If header and footer output is kept in seperate disk files (as I *think* I saw mentioned here) perhaps the write failed due to lack of space, but was not complained about. If there were 3 file outputs, perhaps error checking is missing on one or two of them.

This is the first problem I have ever encountered in the Macintosh that I could not quickly find a work around for. My shining image of the Macintosh got tarnished. Interestingly, I did eventually find work arounds for the problems, and it has taken me much longer to find this sort of frustrating problem than with any other machine I have used before. This speaks well of the overall useability and quality of the system (The IBM PC was so frustrating to me that I felt like throwing it out the window in the first 5 minutes of use!) Perhaps I will elaborate on this topic in a subsequent submission to info-mac.

I hope this stuff is dealt with in the next release. When will *I* be able to get the next release at my friendly Cambridge Massachusetts Computer Store? Maybe I should become a Macintosh Developer???

ReSent-To: info-mac: ;

  I think that many of the people that wish for a color Mac are perhaps not seeing things in perspective. The Mac is part of a *system* concept, and is designed to integrate well with the other components of that system. You could not just add a color tube and hardware to Mac and have that be the end of it. Color tubes draw more power, add a larger power supply. Bit planes require more memory, and probably would require more horsepower from the CPU to crunch that extra memory. Maybe all this extra hardware/power would now require a fan, etc. Also, I think one of

Mac's great features is the ability to print out just exactly what
you see on the screen. So would we not need color printers also?
Maybe even a color laser printer for networking?

  My point is that these enhancements are more appropriate to
a system that is in general of a higher class than Mac. Such
an enhanced system could easily end up two or three times as
expensive as the Mac system. Let's face it, the Mac is the
Volkswagen of the computer industry, which is a valid and necessary
niche for a manufacturer to fill. But putting a Rolls Royce engine
in a Volkswagen does not give you a cheap Rolls Royce, it gives
you a very expensive Volkswagen...

An item in the Toronto Globe and Mail for Friday May 11 (pg. B14)
confirms the 70,000 Macs-in-100-days figure (calling it 20,000 more
than expected) and compares it to the two-and-a-half years it took
to sell 50,000 Apple II's and the seven-and-a-half months to sell
the first 50,000 IBM PC's.
  Other items of interest:
- Apple is "talking to" 250 software developers, 25 in Canada, and this
  will grow to 350 and 35, respectively, by the end of the year.
- A "flurry" of software announcments is expected in June.
- The Mac has "also stimulated an unprecedented demand for Lisa".
- Xerox Canada will carry the Mac and Lisa in its retail stores.

p. rowley, U. Toronto

CMU has received about 500 Macs to date. If that is average among the
24 Consortium schools, which I doubt, that makes 12,000 sales at $1000.
I'd be more inclined to put the figure at 5,000-6,000, but I don't know.

[Last message on this 'subject'..... Ed.]

Let us set the record straight.

I know of three cases of applications for "Developer Status." All were refused. I probably would have turned down one of them myself. The other two seem highly qualified, and if I were hoping to get software out for my system I'd have thought them owrth encouraging.

I am pleased to hear from STERNLIGHT that there are apparent exceptions to what I was persuaded was the rule. One reason I ask questions on the net, or even make statements, is to find things out; unlike Dvorak, who recently bragged in his San Francisco Chronical column that "a columnist doesn't have to check his facts" I tend to do some homework before I publish.

My interpretation of the facts remains my own business. I don't apologize for being wrong; why should I? On this net, one says what one thinks is true; one will get corrections soon enough. Isn't taht its purpose? Without information sources, how the devil will I know.

On the other hand, it remains a fact that Apple did sufficient exhoration of hobbyists and hackers to make it a reasonable expectation from all three I know of who applied that they'd be accepted. There was also considerable hoop-lah about how much software would be developed, adn when; it was, after all, a major selling point.

My suspicion is that Apple originally meant to grant "Developer" status to a far larger number of people, then found sales much better than expected. They didn't need so many discounted machines sold to get them far out on the learning curve for manufacture, so they could charge full price for more of them than they'd thought. They chose to do that. This is not an unreasonable decision. Most corporations probably would make the same decision.

Whether it was a WISE decision is another matter.

I repeat: certainly Apple would lose little by granting developer status to every Ph.D. gainfully employed in the computer business who applies. They would lose little by granting Developer status to any hacker with a good track record, even if the track record consisted of work on programs in other people's shops rather than on their own. Sure: they'd lose, say, 1000 full price sales, at most. That's a million dollars. No small sum. But if within that thousand there was one VisiCalc...

True: the VisiCalc people had no special developer status. no one had. But the Apple II was a prety open machine, much easier to understand thd interface to. Is the Macintosh that simple? Apparently not, else there would already be some of that promised flood.

I don't know where sternlight gets the notion that I dislike Apple. I don't much care what company competes with IBM so long as somebody does it successfully. I'm a little weary of the breathless hype, and VERY weary of the Apple-polished corporate image of the Good Guys who are somehow differently motivated, but I can make that statement about other companies I know of.

If the Mac had 500K of memory and a second drive, then it would be worth $2500 and more; alternatively, it's worth a fair bit less in its present state. That, of course, is merely an opinion, based on considerable experience with a number of machines (including a Mac).

Now: if Sternlight's angry little tirade is answered, then I too am willing to pass on to another subject. I alrady was; that's why I "changed the subject" after he pointed out that I was mistaken in one point of information. I hadn't know that I was supposed to acknowledge that I'd lost some kind of debating point; however, I'm perfectly willing to make that acknowledgement if it makes him feel better.

Last point: does anyone know WHY it is taking so long to write useful applications programs for the Mac? One story we heard: Apple intended to do it all in house. They had not intended even Microsoft basic. Then, very late last year, they discovered that they were not going to be producing any useful software (other than the ability to produce 9 page illuminated manuscripts) before the Mac was to be releeased. There was panic calls, including to Microsoft; which is why the Microsoft Basic implementation is such a kludge (14 K workspace!).

Anyone know whether or not that's true?

Next rumour: AT&T will sell Macs with 256K chips. I

keep hearing that. It makes little sense to me. I have no confirmations, only multiple sources. Anyone know?

The main question remains: if it's so easy to interface with the Mac and write software for it, why has none appeared? Is it being held for COMDEX; or is it harder to write than was supposed?

Does anyone in netland know the protocol for the SendOne/GetFile transfer programs that Apple includes in its software supplement to the Mac? We haven't been able to find any documentation on this in Inside Macintosh. Any information would be greatly appreciated. If I receive some useful information I will repost it to the net.

Thanks in Advance

The May issue of BYTE talks about the new addition to the Apple line: The Apple IIc. In addition, on page 282, they mention a new printer

called The Scribe. The Scribe is a plain-paper thermal transfer printer with color capabilities (no price announced but expected to be in the $300 range) The Scribe, it is said, will print on virtually any paper surface and projection transparencies. It is designed as a printer for the entire product line including Mac's and Lisa's.

The BYTE article
goes on to say that output appeared to exceed the Imagewriter in quality.
It operates at 80cps (draft mode) or 50cps (letter mode)
Dot resolution is 160 horizontal x 144 vertical per inch or 23040 dots/sq in.

Color printing is done by a color ribbon with a spectrum of colors arranged in bands on the ribbon. About $5 for a 80,000 character black ribbon and about $8 for color. Any estimates on how much text is 80,000 chars?

The printhead is a proprietary device that consists of 24 resistance elements that are arranged in a vertical column. While printing, the head is pressed against a polyester ribbon with carbon filled paraffin ink on it. The resistance elements are pulsed briefly, heating them and melt the ink to deposit it on the paper. The temperature range of the resistance element goes from 300 degrees F to 95 degrees F in several microseconds.

Individually, a few of Jerry's points make some sense, but taken together I am not sure. For example:
-Apple may be going for market share. I am sure that they are based on advertizing strategies, but we will not really know as long as they can sell every Mac they can make at the current price. If they drop the price as production catches up to sales THEN we will know they are going for market share. Until then we do not know.

-To be useful by Jerry's definition, a Mac needs a second drive and a printer which does not bring the price to $4000. First he complained that the second drive was not available. Is he now complaining that it is available?
-Jerry's main concern about software is that there is not enough software right now. I cannot understand how changing the certified developer program would help with that. If Apple approved everyone who applied from here on they would still contribute little software until soemtime next year.
-If I see a BYTE article which says that there are only 7 or 9 (or however many there are right now) software packages currently available for the Mac, I hope it also reads "(as of May 7)" or something like that. The "Update" on the Macintosh and Lisa 2 in the current BYTE seems to have been written right after the January 24th meeting. With such a lag time, any claim to little software is likely to be very out of date.
-I am not too worried that no software will arrive. I might be if it were all still in design or development phases, but much of it is in Beta test and very little that makes it to beta test does not really ship.
-We all want the software to be well tested and really custimized to take advantage of the Mac. We complain about the MS-Basic which seems to be a quick port. We also want all of that software right now. I would rather wait till June for well tested software than get something now that works as well as some of the early software on some other machines. The ONLY editor that I am aware of for the IBM-PC when it was announced was EDLIN which as you might guess is a line editor.

I do have a possible correction to make. Rumors still seem to indicate that in the early days of the Certified Developer program there was a 90% acceptance rate. When they reached about 1000 certified developers (far more than anticipated) they seem to have decided to change that acceptance rate significantly (this is just a rumor to me, but others seem to support this). Perhaps when their staff figures out how to support the volume of developers already accepted they will change the acceptance rate again. Thus I stand corrected. Back when they told me that anyone with the right qualifications would be accepted that was true, but it may no longer be true.
Chad

I got the new stuff (Finder, MacWrite, DiskCopy) from my store on a
completely informal ("I can't really tell you where I got it...") basis.
All seems well EXCEPT MacForth craps out at initiation using the new
system folder. BASIC seems to work ok, and I haven't checked Multiplan yet.
-r
ps... The new "About the Finder" is pretty cute.

I recently got my update to Aztec C (Version 1.06B). One of the disks

had a bad side, but they're going to send me a new one right away. They distributed this version on two double sided disks that have to be turned over on my Apple. Besides Manx I've also purchased Microzine from Scholastic Software and Graphics Magician from Penguin Software in this form.

That brings me to a question. Have you ever cut a WP notch in the off edge of a floppy and turned it over to use the other side? I tried this for backing up Penguin's Graphics Magician. I just used an Exacto knife I had laying around and measured the spot with a ruler. It worked just great as far as I can tell.

Then I read an article about why turning over disks is not a good practice. According to the article, when the disk spins in the opposite direction dirt drops out on the disk instead of being picked up by the jacket liner. Is this a real matter for concern? If it is then why do companies like Manx, Penguin, and Scholastic distribute their software on floppies that have to flipped over? Even if the disks they use are certified for double sided use, they still spin in opposite directions when you turn the disk over to use the other side.

They might rationalize that you will back your new software up right away and never use the original disks enough for this to be a problem. That can't Scholastic's reasoning since their stuff is protected. If this is truly a problem, and not just propaganda written by some disk manufacturer, would Scholastic be responsible for a disk drive head problem since their disks could contribute to the failure? Anyone have any thoughts on this topic?

I have ANIX 1.0 by Lazer Systems - it's sort of a UNIX lookalike, but it lacks such niceties as pipes, hierarchical directories, multiple processes, and a few others. The real hardware nicety about it is that

it is file compatible with DOS 3.3 but faster. There was supposed to be
a Version 2.0 to follow, but I haven't seen it. Does anyone know
anything about it, or has Randy Hyde, the author of Version 1.0, gone on
to bigger and better things?

Also, I'd like opinions on LISA V2.6, which is Lazer's assembler/editor
that runs under ANIX or under DOS 3.3.

Thanks, as they say, in advance.

Cheers,
Dick Binder   (The Stainless Steel Rat)

There most certainly is a fast high-level language available for the
6502. It is called ACTION! (TM Action Computer Services) and is
marketed by Optimized Systems Software. It is currently only available
for the Atari computer but the C64 version should be out 4th quarter
this year. There were initial plans on doing an Apple version as well,
but the lack of interest from Apple owners caused that version to be
scrappd (8088/86 MS/PC DOS versions should be available 1st or 2nd
quarter of 1985).

For people who are familiar the BYTE sieve (prime number) bench mark; ACTION!`s execution time is about 10 seconds with register (zero page) variables (1.8 MHz Atari, no screen DMA). This time is better than any other HL language listed for either the 6502 or Z80 (even at 4MHz!)! Even without register variables, ACTION! executes it in about 12 seconds (sorry, I don't remember the exact timings off the top of my head). The source for the sieve compiles off of disk in about 2-3 seconds (most of that time is spent opening the file) and in well under a second from the editor buffer (there is an editor built into the system).

Now a little background about the language. First, it generates native 6502 machine code (you probably guessed this already). The code generated normally is 2 to 3 times larger than ASM and runs 2 to 3 times slower, but it depends on the programmer (of either). The compiler is one pass recursive descent and is very fast. ACTION! is not a PASCAL or C compiler, but it does support many of the control structures found in these languages. ACTION! does not support recursion, thus it gets around the problem of needing a 16 bit index register (static allocation for both local and global variables and arrays).

If you want more information about ACTION! please let me know.

I'm using a Hayes 1200 Smartmodem on my II+ with no problem, with the Apple SuperSerial Card. Although I'm now driving it (them) with my own little assembler program (so I can handle x-on and x-off and run the printer) I originally started with just the terminal-mode ROM code in the SSC. As I recall, it was important to get the baud-rate set right on the SSC (the Hayes detects what baud you are using when it sees the AT) and to get parity right, 'though I'm not sure how critical that was.

The other point was to start the SSC with IN#3, not PR#3 -- that may be what you need too. I don't know if the IIe has hardware scrolling on the 80col screen (I assume not) so to run at full 1200 you have lower the screen window a few lines or you'll lose characters at the beginning of lines.

I have recently had my Apple /// computer stolen.I still
have all the manuals and software that I want to get rid of.

Most of the disks are original masters, and all of the manuals
are in excellent condition.

Any interested parties can send me mail, and I will send
you a list of the items.

I seem to have been in limbo when the II/c was announced (a reasonably
normal occurance for me). Can someone post or mail the details of what it
is (and isn't) along with pricing and when I might actually be able to
see/buy/take_one_home? I've heard 1295 with one disk drive and no screen,
full IIe compatibility with 80 column and extended graphics included. I've
also heard there are no expansion slots. Is this true? Anyone want to make
editorial comments on this thing?

chuq

It takes a while for new items to hit Hawaii so if this is old news for all of you, PLEASE NO FLAMES!.

I had a chance to play with the new Apple //c for about an hour today. Here are some facts and impressions. This is over and above what has already been discussed previously in net.micro.apple

I/O ports

- Composite video out (RCA type jack)
- RGB video out (DB-15)
- External disk drive DB jack
- Two DIN type serial ports (one assigned to SLOT 1 the other to SLOT 2)
  speeds up to 19.2K baud supported
- Joystick/Mouse port (DB-9)...Apparently interrupts are supported on
  this joystick port unlike the II+ and //e
- Earphone (miniplug) with volume control (speaker output also controlled
  by the volume control)

The keyboard layout is the same as the //e. However, the keys are flatter (not chiclet though) and have what might be called "half-travel." A switch on the case can flip the keyboard state between QWERTY mode and DVORAK mode (nice touch!).

The CPU is the CMOS 65C02. In addition to being a low power device, the 65C02 has more instructions available than the 6502. Among them are some I have long waited for:

```
PHX       ;push X reg to stack
PHY       ;push Y reg to stack
PLX       ;pull off stack to X reg
PLY
```

and also additional bit field commands.

The soft switching from 80 column mode to 40 column mode is much much cleaner than the //e soft switch in that direction. No funny business like on the //e. And yes, PR#0 and PR#3 will switch the modes just like before.

The disk drive seems a little noisy during zero track seeking but is quiet at other times. The unit seems to run fairly cool. Although the main unit is small and light at approx 7 lbs., the power transformer is a heavy 5 lb box with a think cable connecting it to the //c bringing it to 12 lbs.

The flat screen display is supposed to be available soon for around $150 which brings the //c w/ display price to $1445 + tax (if any where you live). If no major defects turn up in the initial weeks, I plan to get my //c sometime in July or August. More then.....Anyone brave enough to be the first on the block and report more on this machine?....todd

In the fall of 1980 back when Roger Wagner Publishing, Inc. was called Southwestern Data Systems, they had a little $34.95 word processor called "The Correspondent" for the Apple II+. This was back when micro software came in ziploc bags (tm of someone or other) and little companies appeared and disappeared overnight. In any case, while I didn't expect SCRIPT or nroff for $34.95 (the only two formatters I had ever used up until that point), there were a few changes and additions that seemed necessary. I fired off a short letter to Roger Wagner and promptly forgot about it.
A few months later I received the brand new DOS 3.3 version of "The Correspondent" with a letter saying this update was free and their way of thanking me for my comments and criticisms of the earlier version. Needless to say I was quite pleased back then (around the summer of 1981).

Imagine my surprise when I found a package shipped UPS Blue waiting for me today (5/1/84) from RWPI and found that this box contained the latest incarnation of that $34.95 program I bought nearly four years ago. The letter enclosed said that they had not forgotten my comments on that early version and that this package was also gratis.

What can I say? In this day and age when I can barely get firms to send me updates that I pay for (is Microsoft listening?...I am still waiting for my MS-DOS C Compiler V.2.0 update!!!!!) it is quite nice to know that some software companies out there remember their old customers from the ziploc days.

The least I can do is tell you what the package is all about. The package contains

1. the latest version of "The Correspondent" word processor which supports both 40 and 80 column modes on the II+, //e, and //c The disk is NOT copy protected and uses Diversi DOS for enhanced disk access.
2. A couple of nice little utilities to a) get a free sector count, b) obtain load address and length of the lasted loaded binary file
3. "The Analyst" which helps determine the readability of a piece of writing
4. "Tut's Typer" a hi-res game to help to learn to type (very nice, by the way).
5. a paperbound copy of "Strunk & White: The Elements of Style"

  1. Can anyone recommend a z-80 macro assembler for a
PCPI z-80 card running on a FRANKLIN 1000?
  2. Does anyone know where you can purchase Digital Research's
CPM documentation ? (none comes with the PCPI card) Given the
documentation's rep is it worth it or would a 3rd party book
be better?
                thanks,

One Z80 macro assembler for cp/m which should run on any apple z80 card
is the one from AD2500. They make an excellent range of programs at very
reasonable prices.

Get yourself a 3rd party book or two.

    I wanted to add a three position switch to my apple drives. One
position would write-protect the disk independent of the disk notch,
one position would write-enable independent of the disk notch and the
third position would allow the disk notch to function normally. This would
be easy to do if one side of the disk notch microswitch was grounded or tied
to +5V.
    To my great dismay, I discovered that the disk notch microswitch
is not connected to ground or +5V. On page 146, Circuit Schematic: Disk II
Analog Board, The DOS Manual, one side of the microswitch is connected
to the pad marked W PROT and the other side is connected to WP RET.

W PROT is wired to IC B4, pin 2 which provides the microswitch status to the digital card. WP RET is connected to the Phase 1 line.

Does anyone know why the Phase 1 connection is made? Why isn't this side of the switch simply grounded or tied to +5? What would be the consequences of breaking the Phase 1 connection?

<>

I have recently purchased a Mac., and would like to know what future software/hardware will be available for it. Does anyone have any relevant information?

I purchased MacWrite/Paint and it's pretty good except that as of now one can only write about ~12 pages worth of text. Hopefully something better will be coming out soon. I've also got microsoft basic and an advanced copy of MacBasic/MacPascal. The MS-basic is quite interesting (it has good mouse control commands) but since I don't have a manual for the apple software I've had a hard time getting to use it properly.

I'ld like to hear about what others have to say about the Mac and related topics.

Is there a C compiler out there that does not use the Z-80 card
for the apple II?
If so, where and how much.
Also, does anyone know of any parsing techniques suitable for
micro-computer implementation besides recursive descent, and operator
precedence.

Why anyone would use recursive descent is beyond me. Try an LL(1)
predictive parser. You might want to keep the operator precedence
grammar for expressions. This is just as powerful as the recursive
descent parser (recognises the same grammar(s)) but avoids recursive
overhead.

This brings me to... has anyone written a parser generator for LL(1)
grammars, sort of like YACC? I'm planning to do it myself when I find
the time, but would be overjoyed if someone had beaten me to it
(and was willing to make it available).

Regards,

You should be able to get some of the information you want by reading the publications about the MAC -- ST. MAC, and MAC World. The April issue of MAC WORLD has an article on pg 110 which presents a simple program using the mouse in MS BASIC, MAC BASIC, and MAC PASCAL. All three listings are well-commented, and suggestions for improvements given. You should be able to use the examples to do something with Pascal and BASIC. Another source of info is Compuserve (and, presumably, The Source). There is a very active MAC group running on CompuServe, and a very good terminal emulator written in MS BASIC (MACTEP) is available on the X-access database for the Apple SIG on CS. By some accounts, MACTEP is *much better* than MacTerminal!!

By the way, *HOW* do you get your hands on pre-release versions of MAC BASIC and Pascal???? I live in the same area as Apple--even have some internal connections (of possibly dubious quality), and I can't seem to get anyone to let loose of a copy!! This goes for MacTerminal, the new 4-pass copy routine, and the update of MacWrite which is supposed have sub- and superscripts, etc. What gives here? What have you guys got that I don't have? (Besides the pre-release stuff, of course.)

Has anyone actually "played" with the new Rana 8086/2 which turns the
Apple //e in an IBM PC clone? The 4/30/84 issue of Infoworld says that
for $1795 the Rana 8086/2 adds an 8086CPU, 2 360K drives (which can also
be used in the Apple mode), 256K RAM (expandable to 512K), and MSDOS/PCDOS
compatibility. I would like to have more information about this product
from someone actually using it.

I assume you're worried about the size of the parser, since any parsing technique suitable for mainframes ought to work also on micros if the program will fit.

If you have access to a parser generator such as yacc, use it and don't worry about what kind of parser it generates.

Yacc happens to generate an LALR(1) parser. A book on my shelf claims that an LALR(1) parser table for Algol 60 occupies less than 3000 bytes. I would guess that an LL(1) parser table would be about the same size.

A true recursive descent parser is just an LL(1) parser in which the parser table is encoded procedurally. I would expect table-driven LL(1) parsers to be more compact than recursive descent parsers.

If you don't have access to a parser generator, use table-driven LL(1) or recursive descent. Just be careful as you transform the grammar into LL(1) form. Consult a good textbook on compiler construction such as Aho & Ullman or Hunter.

So I know how to get the funny screwdriver and open up my Mac. And
yesterday I desoldered a 68 pin socket from a 6 layer PC board without
any damage. And I have a few 256K DRAMs.

If I plug them into a Mac, will it know about it or is there more to
it than that? Has anyone done this yet?

I am trying to find file transfer software to work with a //e with a
softcard and Novation Apple Cat modem under CP/M.
I have Apmodem.asm version 2.0, but it doesn't support an Apple Cat.
Does anybody out there have an update that supports the Cat, or enough
information on the modem to let me take a wack at it myself.

ProDOS recognizes cards just like Pascal does. Each card has a signature
or should if it follows the standard. Of course, some cards don't and
the software doesn't necessarily know about it. One place to look for
the info is the BIOS/driver doc for Pascal which is available from IAC.
If you need more info or someone else doesn't provide more, let me know
and I'll dig out the actual document.

Manx C65 also uses a few locations in page 0 for register variables.
This works quite well for high usage loop variables and pointers.
If the range of a variable is known to be small, you can declare it char
and get very fast and small code. Of course, you can also warp your
programming style and make heavier use of globals.

Dave,
  If you're interested in accessing your mm from pascal, check
the back issues of Byte. (They put out an index in December 1982,
that would be the quickest way to find the article.) There was
an article done maybe in 1981-82 that contained an Apple-II Pascal
Unit that interfaced with the micromodem pretty cleanly. All
code was included in the article.

  This is in replay to your 3 May 84 message.

In the new Softalk Magazine issue (May 84), some Apple //c specs are explained (although not into incredible depth and I would just like to round up some of the points that Margot Comstock Tommervik wrote about in her copyrighted article. Hopefully, this will reduce speculation on the workings and the layout of the machine itself to the net.

1. When I said earlier that the Apple service rep that I knew said that the 'c' in the name Apple //c meant 65C02 and not 'compact', that was his opinion, not mine. And since he works repairing them anyway, I mearly reported it to the net, although I belive that 'c' means 'compact' also. It seems that he was wrong as most publications (including Softalk) are saying that 'c' means 'compact' so I guess he was wrong. Sorry Ron.

2. Basic Specs. The Apple //c is a full Apple//e smashed into a size of about 11" x 12" x 2". It contains 128K, double-hires capability, eighty-columns, a full //e confiquration keyboard (although the keys are smaller and not full- stroke, but managable and much better than the PCjr) and upper and lower case standard (even accepted by Applesoft!!). It weighs about seven pounds which is about a third of the weight of the PCjr and has a built in handle for transportability. The rumor around Appleland is that whoever was in charge to design the //c went into Sears and found the smallest briefcase that he could find and proceeded to build the //c to fit inside of it.

3. I/O. Being as small as it is, the //c obviosly dooesn't have any slots, but it does have 2 serial ports (RS-232), an extended video port for RF-modulator, RGB or liquid crystal display, a composite video port for regular monitors, an external disk drive port, and a mouse/joystick port. Earlier, it was posted to this bboard that the old Disk][drives could not fit the new port for the //c and they wondered if a second drive has been developed. Well, there is a second drive and it is a half-height design that looks very nice beside the //c as they have both the same basic external design. Just above the keyboard are a couple of thin, apparently heat-sensitive buttons which

are a 80/40 column switch (pokes to the old soft-switches and PR#3 still work but this switch is for the user's sake) and a button marked "keyboard" which toggles the normal QWERTY set and the DVORAK standard. There are two lights on the right side above the keyboard, also thin which are for power and disk-in-use. The Reset Key has been moved to the left of the 80/40 column key in a slanted box shape. Presumably, it takes the same combination of Control-Reset to actually reset the machine. Although the alticle does not specify, I suspect that the two serial ports are logically in slots 1 and 2 as mosts if not all Apple users have their printer cards in slot 1 and their modem cards in slot 2. The mouse probably paralles some other slot that Apple has chosen to use (either slot 4 or slot 7, probably slot 7 for the eighty cloumn cards is logically in slot 3 and the old Apple Graphics tablet defaulted to slot 5. Maybe the mouse also needs the video signal (which is only available in slot 7 (PURE SPECULATION)). The disk drive controller is always in slot 6. I suspect that most users will not miss the absent slots as there will be two serial ports to use and the mouse option is there also, which means less cards to buy (another cost consideration and card compatibility lessens as a factor as software companies begin writing software to take full advantage of the //c (the serial ports shouldn't really have compatibilty problems anyway). The built-in disk drive is not a Sony 3.5 inch design like sopme people think (That would be a huge software compatability problem), but instead is a standard 5.25 inch half-height which fits in snugly into the design and has its opening on the right side of the machine.

4. Other ramblings. The //c does not have an internal power supply but instead an external one that weighs a pound and is about the size of a small brick. Not having an internal power supply makes the possibility of using the //c with a battery pack much more feasible and it (the power supply) costs about fourty bucks. No word on when a battery pack will be made or if it will be even made by Apple......The flat LCD screen that has been promised for September delivery weighs less than a pound and the carrying case that Apple sells for the //c already has a pocket for the monitor. It is standard LCD black and white flat screen and supports 80 x 40 clomns for text and 560 x 192 for double-hires graphics. It will work for everything although fast hires graphics will leave trails on screen. The only thing the article doesn't mention specifically is price although I've heard that it is somewhere in the $1200-1300 range ($1295?). That may make a $300 dollar C64 seem very inviting but when one adds its $600 disk drive and one takes into account the memory difference (which Commodore has been bombarding us with in its ad campaigns for some time about other machines--128K v. 64K), then the price doesn't seem too bad at all (although it could be a little less). Also, the disk drive PROM has been slightly changed so that if there is no disk in the drive upon boot or the drive door isn't closed, instead of spinning blinding into eternity, a message appears on the screen, "Check disk drive". And of course, the ProDOS operating system is standard.

5. For Apple purists. Apple is changing the way they make their

machines. The color of the //c is NOT the traditional beige found on all their previous models but instaed is oan off-white oyster color with a beige keyboard. Also, the old keys with white plain lettering on][s,][+s, and early //es is gone replaced by thin black italicized lettering. This is a change for the better from the new //e keyboard lettering which looks borrowed from the IBM PC (small black lettering in the key's upper left hand corner). However, I still like the old][+ keystyle. Oh well, progress I guess.

That about rounds it up. It still runs about ninety percent of the old][+ family software and just about all of the //e's software (that isn't protected by ROM checks, as there have been slight changes to a few rountines. Time will tell on how soon it blows the PCjr out of the market, but from indications of the PCjr's sales, it just might be doing that to itself already. Word is from the big blue that the PCjr will soon receive some improvements to memory (512K), a new keyboard, and other enhancements so I guess we can't count IBM out yet.

"Beam me up, Mr. Scott"

Actually, the use of a 3.5 inch drive wouldn't have caused massive software problems -- it could have looked identical to the software. But there would have been considerable MEDIA incompatibility. I do wonder how much mileage Apple can get out of a 1 Mhz 8-bit processor and low density disk drives. Now, a 512K Mac with an 800K Sony drive in the //c box (and an LCD screen) would be more like it!

I wasn't entirely correct when I said that ProDOS doesn't care
what peripherals you have but that the STARTUP routine looks at
the signature bytes when you select the S[lots] option.

Actually, ProDOS does look for disk devices and a clock card.
It is things like serial line interfaces, printers, and mice
that it pays no particular attention to until the IN# or PR#.

The latest issue of A+ also covers the Apple //c. Some additional
points beyond what you covered:
     - The power supply input is 12V with a wide tolerance,

making the automotive electrical system a good power source.
- The 80/40 col soft switches etc. are supposed to be improved over the //e, although there are indications that the same custom logic (MMU & I/O control) chips are used. I have to admit that the //e is tricky to use in 80-column mode.
- Since the Apple Mouse II likes to live in slot 4 (this is what the available software defaults to), that would be my guess also for the Apple //c mouse slot.

I have actually played with a //c for a while and the keyboard is satisfactory.

The Apple //e is tricky to use in 80 column mode??? C'mon, gimmie a break!! For the majority of the software that I use, 80 column mode is the ONLY way to go. Apple Pascal boots up in 80 columns with no problems whatsoever. (Heck, I've never even seen Pascal in 40 columns!) Applewriter //e, Prodos, and MVP Forth all use the 80 column card without a hitch. The only time you will run into problems with 80 columns is when someone wrote their own character output routines and wrote them especially for the 40 column screen.

Sitting at my Apple//e, staring at the 80 column screen,

Doug Hall

I have an Apple //e with running CP/M with the Appli-card. I am looking
into purchasing a hard disk (probably a 5 or 10 MB removable) but have
not found one that will run with Apple DOS , cp/m , and the p-system.

Has anyone had some experience with hard disks on an Apple or know of any
hard disks that will support these 3 operating systems. Please post
responses on the net or mail to me directly. I will post any info I
receive.

Thanks,

Ron Breger

I forget exactly who said it and when but the person was quite
sure that the IBM PCjr would be extremely popular with two or

three years. He continued to say that the PCjr would be one of
the most popular computers of all time.

Idle speculation about who is going to blow who out of the water
is silly. Apple is doing well, as is Commodore, IBM, etc.

What possible reason would you have to USE an LL(k)-based parser generator?
(given that you can use yacc, that is.) Yacc is based on LALR(1), see
the paper by Aho and Johnson (Computing Surveys, 1974 -- happy 10th
anniversary!), and is far and away the easiest tool for HUMANS to use to
construct parsers; by contrast, LL(1) is much more restrictive, and
operator precedence is a REAL bear.

Sorry, didn't mean to come on so strong, there. IS there any good reason
to use any top-down method?

This is a followup to two articles actually. As this discussion
is leaving the original topic (availability of a C compiler for
apple) and is going into issues which are of further interest to
net.lang only, I am cross posting this to that newsgroup. Anyone
following up on this should remove net.micro.apple from the list
of newsgroups.

The two articles in question are (partially) reproduced below...

>> In response to "why would anyone want to write a recursive descent
>> parser"
>> Okay, well gee, as i understand it, as told to me by the gentleman in
>> hawaii, the ll(1) parse tables are not easy to fill in.
>> I suppose you should ask Per Brinch Hansen or
>> Hoare, why they recommend recursive descent for
>> micro computers.
>>
>> It seems that the only feasible way to write a parser for
>> a MICRO-COMPUTER is to use recursive descent. This saves
>> the time that would be spent figuring out the parse tables
>> for ll(1). Also, there are a zillion states for even a moderate
>> sized language.
>>

Also ...

>> If you have access to a parser generator such as yacc, use it and don't
>> worry about what kind of parser it generates.
>>
>> Yacc happens to generate an LALR(1) parser. A book on my shelf claims
>> that an LALR(1) parser table for Algol 60 occupies less than 3000 bytes.
>> I would guess that an LL(1) parser table would be about the same size.
>>

>> A true recursive descent parser is just an LL(1) parser in which the
>> parser table is encoded procedurally. I would expect table-driven LL(1)
>> parsers to be more compact than recursive descent parsers.
>>
>> If you don't have access to a parser generator, use table-driven LL(1)
>> or recursive descent. Just be careful as you transform the grammar into
>> LL(1) form. Consult a good textbook on compiler construction such as
>> Aho & Ullman or Hunter.

Regarding the second article. LALR parsers are incredibly difficult
to write by hand. Try and write a table for the 5 line grammar in
Aho and Ullman. I don't have it handy, so I can't refer you to a page
number. However, it is in the section on writing LALR grammars
(what else).

Now, the first article was a followup to one of mine advocating
table driven LL(1) over recursive descent. The points raised (in
order) are -

1. Recursive descent is easier to write than table driven
    LL(1)

This is probably true. However LL(1) tables are by no means
difficult to write. An algorithm suitable for machine encoding
(very easily) can be found in the book by Rosencrantz, Lewis
& Stearns. It can be done by hand quite easily. Also, with
a little bit of effort, one can rewrite an LL(1) grammar as a
Q grammar (Non terminals directly derive either null, or a
right hand side that begins with a terminal). Finding the
selection sets for Q grammars is a relatively trivial operation.

2. Recursive descent is more "naturally" suited to micro-
    computers.

This, I don't buy. With a micro, you usually have memory
constraints. Recursive descent automatically requires use of
a higher level language supporting recursion. It also requires
that you add in the overhead for recursion. Table driven LL(1)
is likely to be *much* smaller. The driver for this is also
relatively simple, and could be written in assembler (far more
easily than that for a recursive descent parser). A further
advantage is that changes to the grammar only require changes to
the table. I submit that this is "better" (subjective) than
recoding as must be done with a recursive descent parser.

LL(1) parsers (in general) also have the "prefix property" of
catching an error as soon as it occurs, rather than at some
later stage. LALR parsers don't.

An ambiguous operator precedence grammar is probably better
for parsing expressions.

Regards,

Are there any *real* Pascal compilers for the Apple][(+,e)?

I know about: Apple Pascal: compiles to p-code
               Turbo Pascal: runs on Apple with CPM card

Is there any Pascal that compiles to true 6502 assembly code for the Apple?

Is there any Pascal for any other 6502-based machine that compiles to true 6502
assembly code?

Is there anything faster than Apple Pascal?

For Sale: Koala Pad touch tablet
==========
for the APPLE II, II+, IIe

Condition: mint condition (like new)
Price: $70 or best offer
Includes:
- everything you need to make it work
1. 1 Koala Pad
   - plugs into game port I/O
2. 1 Micro-Illustrator program disk
   - easy to use
   - can draw freehand, boxes, circles, erase, brush types, save, load, zoom, lines, rays, etc.
   - produces Hi-Res picture compatible with at least 1 other graphics editor (e.g. EZ-draw)
3. Micro-Illustrator User's Guide
4. Koala Pad Owner's Manual
5. Stylus Pen

I couldn't find anything in the Apple //e schematics to support
the idea that there is a Dvorak capability present. That does
not prove that it isn't there, though.

You must never have tried to do anything interesting with peripherals
if you haven't had trouble with the Apple //e 80-column card. It has
several problems:
     PR#s where s is not 3 breaks its operation.
     The scrolling firmware is too slow for 1200baud modems.
     Wraparound garbages the first column.
There are other problems but these are indicative.

It also happens to be the case that IF the grammar is LL(1) or even
reasonably close, a recursive-descent parser is:

1. Fast

2. Easy to write, understand, and maintain

3. Easy to embed semantics (and other misc. functions) at
   the right point

4. Capable of acceptable error-handling (assuming you want to
   detect erros, not "fix" them)

5. It mixes well with other parsing techniques which may want to
   be used in parts of the language that may not be strictly LL(1).

The BLISS family of languages/compilers all (to my knowledge) use
recursive-descent for declarations and control structures, and
operator-precedence for expressions. They are also some of the
best optimizing compilers ever built. (It's not a complete non-sequitor,
as the common sub-expression recognition was done during syntax analysis.)
See Wulf, et. al., "The Design of an Optimizing Compiler" (Addison-Wesley).

I am trying to sell an Apple][+. I am trying to move up to the newer
32 bit micros. The system is being sold completely. (Software,
Hardware,manuals...total) The system consists of:

Apple][+	CPM PCPI Card 64k of its own memory
16k language card	Printer Interface card (Epson)
80 column card	Epson MX80 Graphtrax+ printer
micromodem][	(2) Quentin 40 track drives
Kraft Joystick	Surge protector

The following software is included:

UCSD Pascal II.1 Apple Pascal (w. several enhancements)
Turbo Pascal 1.0 for CPM (Super!)
Powertext Word Processor
Aztec C compiler for both CPM 80 and C65
muMath/muSimp Symbollic Processor (super for students of math and
physics can solve equations up to 37 variables in seconds)
Sensible Speller spell checking package
Wordstar, MBasic, JRT Pascal 3.0, Fortran 66, Cobol 74, Microsoft Cobol,
Microsoft Fortran, Basic Compiler for Applesoft, ProDos, Modem7, CLIP
Unix like command processor, Several games, and other DOS software.

I'm asking $2700 or best offer.

In response to "why would anyone want to write a recursive descent
parser"
Okay, well gee, as i understand it, as told to me by the gentleman in
hawaii, the ll(1) parse tables are not easy to fill in.
I suppose you should ask Per Brinch Hansen or
Hoare, why they recommend recursive descent for
micro computers.

It seems that the only feasible way to write a parser for
a MICRO-COMPUTER is to use recursive descent. This saves
the time that would be spent figuring out the parse tables
for ll(1). Also, there are a zillion states for even a moderate
sized language.

Nick.

<--->

The 5/14 issue of Electronics Engineering Times has an article reporting on future Apple Macs. The claim is that the next Mac (called "fat mac" in the article) will compete more directly with the IBM XT. The new machine would have the following:

- o either an internal hard disk or an upgraded interface port that would talk to an external unit at 5 MHz.
- o 512k RAM
- o double sided 3.5" Sony disks

The original Mac would be continued and would be upgradable to the expanded version through the swap of the digital board with its larger 256k RAMS and improved ports. They suggested $3k for the "fat mac" and $2k for the 128k version - no estimate on the price of the board swap. (the $3k is w/o hard disk)

The article goes on to mention that the first development language that will run on the Mac will be an assembler due out in July. It will access the entire toolbox and include a debugger - you will also need 2 Macs to use it. A subset that runs on a single Mac will also appear at that time. Stand alone versions of C and Pascal suitable for software development will be out around Dec.

So it looks like quite a wait for software development tools if one waits for Apple. Does anyone know about any other firms that will offer things like C compilers?

Steve Crandall

The folks at Manx Software Systems (the authors of the AZTEC C Compilers)
swear on a stack of diskettes that they are close to completing their
C compiler for the Mac. I have had good luck with their compiler for the
Apple II (albeit slow to compile).

In general, I agree with Binayak Banerjee's comments on parsing,
but I must correct one minor point, concerning as it does my
specialty: syntax errors (making and correcting them).

LL and LR parsers, including SLR and LALR, all have the prefix property:
the parser will halt when the string of symbols read does not form the
prefix of any sentence in the language. I.e., the parser will never
accept an erroneous symbol.

However, full-blown LR and LL parsers have another property not shared
by SLR, LALR, and Strong LL (the usual implementation) parsers: Immediate
Error Detection. An LR(1) parser will halt as soon as the offending token
appears in the lookahead; an LALR parser may make several reductions before
noticing the error, and the usual LL parser may pop several symbols off the
stack. Lack of immediate detection can restrict the choices in error
handling, but it is not the same as the lack of the prefix property.
(Precedence parsers, by the way, often lack the prefix property.)

Anyone genuinely interested in long lectures on syntax errors
is invited to correspond directly by mail.

I am posting the following message for a friend who doesn't
have access to the net. He is looking for someone to help write
a FORTRAN compiler for a marketable software package.
Replies can be sent to me or to the USNAIL address:

ISAAC
P.O.Box 172
Coram,NY 11727

ISAAC (Interpreter for Scientific Applications and Associated Code)
is an exciting new interpreter, or more precisely "pseudo-machine",
which has been implemented on the Apple II plus computer. ISAAC
operates in a spirit much like the "p-machine" of UCSD Pascal but is
custom tailored for scientific computations and affords a great deal
of versatility in the handling of numeric data. ISAAC was designed
with an eye towards very precise floating point arithmetic and a
variety of useful data types, including variable length floating point
and integer data, complex numbers, multiply indexed arrays, etc.
ISAAC includes a supporting system: ISAAC D.O.S., file manager,
powerful text editor, ISAAC assembler, 6502 assembler, linker, and
many useful subroutines including lots of special functions,
integer factorization, and an on-line debugger. Because the major
emphasis of ISAAC is numeric computation it is exceptionally suited
for supporting "mathematical" languages such as FORTRAN. A FORTRAN
compiler which generates ISAAC code is in the planning stage and
ISAAC's author is seeking assistance (due to time problems) on this
phase of the project. The hope is to take, as partners, the
entire package to market by the end of this summer. Detailed
information is available upon request.

[]

    Is there any way to use another TV monitor with the Mac ?
I am willing to go inside and do some hard-wiring but I need to
know where to tap into the video signal.

    If it were possible, what kind of TV monitor do I need
(resolution, scan rate) ?

    Any help would be greatly appreciated.

                                        Robert Ling.

[bugs generally start at one end and eat their way towzx$e@1'^%iuy]

     I recently posted a request for information on a good implementation of Forth for the Apple][and][e computers. The response was overwhelming; there are obviously more Forth users (or should I say programmers) out there than I imagined. Anyway, about 90% of the people who responded recommended the implementation from Micromotion. Nobody had anything bad to say about it. It seems that Micromotion has added a number of very nice extensions which make their Forth one of the best for the Apple. Nobody complained about the speed.
     About half of the people who responded use the Apple //e; the other half use the][+.
     Thanks to all who responded. Many people wrote requesting any info I received, and since the requests were numerous, I am posting this summary in lieu of individual replies.

I have had the luck to play with an early version of MacTalk, a phoneme
based sysnthesizer for the Macintosh. For a phoneme synthesizer, it
is very good, especially when you consider that the Mac contains no
hardware specialized for voice synthesis. That 4-voice waveform generator
does it all (no, I haven't made a Barbershop Quartet). The voice
quality is pretty reasonable, and there seems to be some concern for
co-articulation ("the apple" coded as DHAX AEPUL is considerably less
smooth than as DHAXAEPUL). Like any phoneme synthesizer, it burbles
at times, but less than most. Prosody control seems to be quite good, as well.

As someone else put it: "Magnificent Mac"

I recently saw a demonstration of Apple's Pascal, and it looks like it
may be worth waiting for. The debugger allows you to run a program whose
listing appears in one window (with a little finger moving rapidly to
point at the statement being executed), the dynamically changing values
of selected variables appear in a second window, and the program output
is in a third. To set breakpoints, you move tiny stop-sign icons next
to the statement in the listing window at which you would like to pause
to examine or change the state of the running program.

A Basic program for a simple terminal emulator with file uploading and
downloading has been posted to net.sources. It was taken (with permission)
from an item on INFO-MAC on the ARPANET.

One problem: After transferring an ASCII file to the Mac, I cannot find
any way of reading it or editing it. Does anyone know how to deal with
this problem?

Seems the Mac newsgroup is finally getting off the air, albeit under the
disguise of net.micro.apple as yet.

The described trick (editing the equation in the notepad, then copying it
to the calculator using cut/paste) seems easy enough, even for me (who
has never seen a Mac).
One question remains: why can't the input to the calculator be edited
directly? Wouldn't this be even easier and much more straightforward?

I am just starting to work with Turbo-Pascal. Maybe someone can help me with
several questions.

1. How can I direct output to the console to also go to the printer?

2. Is there a way to set the default drive (at start up time) to a drive
other than A:? That is not have to give the L command followed by b, but
let the system start up with B: as default or logged drive?

3. Also at start-up time is there a way to avoid given the Y for the explicit
message OVLY to be loaded. That is make it the default?

Thanks for any help

Daniel

Has anyone had any actual experience with MacForth? I recently glanced at
a brochure for such a product, marketed by "Creative Technologies Inc." or
some such.

Given the present dearth of programming languages for the Mac, meaningful
replies are probably worth posting to appropriate newsgroup(s) on the net.
I suspect many present or potential Mac owners would be interested...

I have a couple of questions about the Mac.

1. Do the terminal emulator programs allow file transfer to and from
the host?

2. What are the limitations on document size?

3. Can you make pictures larger than 8 1/2 by 11?

[This space available...]

Now that I have the BASIC program which was posted to net.sources
which lets my Mac behave like a terminal over the RS-232 port, I need
the appropriate termcap info so that I can use vi, etc.

I know that MacTerm, whenever it is available, will emulate VT100s and
VT52s, but that is sometime in the future and I want to use my Mac as
a terminal NOW!!!

Please respond via mail, and I will summarize and post the results.
If you don't know the answer, please don't ask me; I promise to post
whatever I receive within a week.

Has anyone considered (or done) compilation of code for the Mac in a
language on a UNIX host? C, Coneuc, Modula .... ? What problems
might be anticipated in doing this (assuming one had a proper binary
downline loader)?

Since Apple now seems to say that compilation for Macintosh on Macintosh
will not be possible until the half-meg Macs arrive, and I don't want
to have to buy a Lisa (the point of the Mac is price!), the best alternative
seems to be to use one of the nice languages available on UNIX.
I'm pretty sure that one can get the binary files into a Mac file, but
have no idea how to make them runnable, or how to link to the toolbox
routines. Presumably some of this information is in "Inside Macintosh",
but is there enough information there? I don't want to shell out US$150
if it won't provide the information.

Actually, MacForth is from "Creative Solutions" instead of "Creative
Technologies". Creative Solutions is headed by Don Colburn, who is
very well respected in the FORTH community. His 68000 FORTH is called
MultiFORTH. It has been ported to a large number of 68000 machines in
the past few years, and is in use by an impressive group of large
companies. MultiFORTH is quite mature and well-supported.For these
reasons, I have every reason to believe that MacForth will be (is?)
an excellent product.

No, I have nothing to do with Creative Solutions myself.

Mitch Bradley

According to the New York Times, Apple will introduce a portable version
of the IIe on April 24th called the Apple IIc.

    $1295
    Briefcase size (no display)
    128Kb "internal memory"
    One floppy disk
    7 1/2 lbs excluding 5 lb battery pack
    Full size key board
    Optional mouse

Since the II series is based on the 6502 I wonder how the 128K is mapped.
I am intrigued by the mouse; are they planning a Lisa/Mac-like interface?

[Into the bit bucket]

    The latest issue of BYTE magazine, April 1984, has a preview article
of Macintosh BASIC, which I assume is now called MacBASIC. The article was
very good in that it desrcibed the general operation of Macintosh BASIC. The
idea of a semi-compiled language is very interesting. Anyway, the author also
included some benchmark programs and times for this version of BASIC. I put

the same programs through MICROSOFT BASIC on the Mac and here are the results.

TEST	Macintosh BASIC (seconds)	Microsoft BASIC (seconds)
Empty GOSUBs	3.0	8.0
Empty FOR/NEXT loop	1.5	5.0
Midstring search	9.0	22.0
Real Division(by 3)	18.0	32.0
Integer Division(by 3)	3.0	xxx *
Eratosthenes Sieve	31.5 **	1 min. 45.0 sec **

All times for Microsoft BASIC were done using Mac's clock which only gives time in whole seconds.

* I could not find an equivalent function in Microsoft for Integer functions.

** Macintosh BASIC used short variables for the Sieve and found 1899 prime numbers in 8191 numbers. Using 2-byte integers (as Microsoft calls them), I could only DIM an array for a maximum of around 6500. That's the time presented. By using regular integers, I could only use around a 1000 element array.

According to the people selling MacForth at the West Coast Computer Faire (weekend around March 22), this is indeed the same 68000 Forth that has been on the market and well-thought-of for some time. They were selling a basic system for ~$150 which should have started shipping this week, and

a "developer's system" for substantially more that should ship in about
four to six weeks. I'm not sure of any more detail than that, but I could
dig up the info I got at the Faire or post their address if there is enough
interest.

I would presume the 128K on the Apple IIc will be mapped the same way as
the 128K on an Apple //e.

Apple has already announced a series of Lisa/Mac-like software for the entire
Apple II series. Some is available now and more is coming.

I would imagine that the Apple IIc 128K memory and mouse are the same as on
my Apple //e. The 128K is really two 64K memory pools, each bank-switched
the old Apple II+ way, with the 64K pool selected by soft switch. The mouse
is an Apple Mouse II ($125 including MousePaint software)

Ok, how about the following -

```
     su|dumb|un|unknown:\
          :am:bl=^G:co#80:cr=^M:do=^J:nl=^J:bs:li#24:eo:
```

Seriously, If you look at the code, it basically just grabs a

character at a time from the input and displays it. If you want
to modify it for cursor control and the like, you will have to
replace lines 3080 and 4060 with the BASIC equivalent of a switch
statement that can intercept the characters, decide if they are
control codes, and call the appropriate system routines. Don't
ask me to do it. I can't afford a MAC.

Regards,

I am considering an ALS cpm plus board (6 Mhz, 3.0) for my Apple //e.
Can anyone give me information good or bad on any operational problems
encountered, i.e. ease of installation, tricks, compatibility with
application software currently running under 2.2 (Wordstar, Mailmerge,
dbase, etc.). Is this system a good choice? I also have a 128k pseudo
disk, is this compatible?

Thanks
Jim Kent

Yesterday I went to an Apple sponsored show at a local computer
store and saw the mouse for the AppleII/+/e. It is very nice,
works almost as well as on the Mac, even though the 6502 is not
nearly as powerful a cpu. The mousepaint software was very impressive,
with pull down menus and everything. I was able to use it simply
by looking at the icons and playing with the mouse. Cost is $175,
and to me looks like worth the price.

I got the new product announcment for Pascal 1.2 from a dealer
yesterday. New features include:
     support for IIe, including the additional 64K of ram
     about 40 bug fixes
     provision for ProFile support, which will allow putting
     the entire system on the hard disc.

Cost is $250, the same as Pascal 1.1. If you already have 1.1 and
want to upgrade, the cost is $75 if your Pascal is older than
December 1, 1983, and free otherwise. The upgrade offer expires on
September 1. You can get the upgrade by sending
     1. Name and address, including zip

          and
     2. Original APPLE1 disc
          and
     3. check for $75 if system is older than Dec. 1
        or sales slip if newer than Dec. 1
to
     Apple II Pascal Upgrade
     P.O. Box 306
     Half Moon Bay, Ca.
     94019

You will recieve
     new versions of all for system discs
     manual updates

All of this info is from an Apple new product announcement dated
3/15/84.

A friend of mine is friends with an educational software company that has a
pre-release Apple IIc. He told me the following things about it:

It measures about 1 foot by 1 foot
It has 1 built-in disk drive on the SIDE. (The Side? Is this sacreligious?)
128K built in RAM
Built-in paralell (sic) and serial interfaces (I take his word for it)
He wasn't aware of any expansion slots.

Hmm. Apple would not put 0 expansion slots in... Maybe he overlooked him.
(I mean 'them') Anyway- Computer&Software News claimed that they had seen
the machine and thought that it would "cannibalize the Apple //e's sales"

C&SN said that Apple originally priced the machine at $1300 made a last
minute change to $1550 to distinguish it more from the Apple //e. The //e
is allegedly going to drop in price. An executive at Apple told another
friend of mine last February that the //e would go for $750 sometime this
spring (I don't know what that would include) and C&SN said last week that
the //e would be available for "mass-marketing".

Also in the C&SN news article last week was a little section on how Apple
had removed a "location clause" from its dealer agreement. I think that
this deregulates the Apple Dealership a certain amount.

Rumors, Rumors, Rumors, about new Apple products. Meanwhile, I plug away
at my 1980 II+, which I am glad to say is being supported by Apple. Can you
expect the same from Atari, Commodore, or the others? And here is some
raw speculation: I think Woz is conjuring up an Apple //e board for the
II+ for next fall (80-column upper/lower case, 128K Ram?)

While I am at it, I might as well say that Apple was planning an Apple //x
(Yes, 'x') that would include

     1 Megabyte of Ram
     16 bit 6502c microprocessor

But the 6502c won't be available until late '85...

                    In search of new Apple-Ications---

I need some advice about using an Apple //e with UNIX. For the past year I've been using a //e (and AppleWriter II) for word processing at home and UNIX (HP 2624B, vi and mmx) at work. It's been frustrating at times dealing with the two editors and not being able to transfer files. I now have the opportunity to replace my 2624B at work with a //e.

In addition to the normal //e and terminal emulation modes I hope to be able to use the //e in two additional modes:

- as a UNIX terminal for vi, netnews, etc., but using the //e disks for file storage

- just like at home but using mmx as a post-processor with the XEROX printer, etc.

I've ordered a 128K //e with the new duo-disk drive and monitor. I have a leased 212A modem. I haven't chosen a printer yet. I'm using an Apple DMP with a Grappler at home and am happy with the combination. I'd like to get the //e mouse and MousePaint - it sounds nifty. I expect to continue using AppleWriter II (or maybe AppleWorks). Questions:

1. What terminal software packages should I be looking at?
2. What is the best serial interface to the modem?
3. What cable do I need to the 212A (which pins connected, tied together, etc.)
4. Can I do graphics with the Imagewriter and the //e?
5. Any other comments or recommendations?

Thanks,

Doug Anderson houxf!dma

I have a couple of questions and a comment on the AZTEC C compiler discussion that's been going on.

1) I have an Apple //e with a MicroSoft Softcard CP/M card in it. I thought I would just have to live with the frustration of having my screen cleared every time CP/M did a warm boot. Then I found out that not all CP/M systems clear their screen this way. Why does MicroSoft's? How would I go about changing it so that I just got a message saying "warm boot" like some systems I've heard of?

2) I use a terminal emulator called M.I.T.E. from Microft Labs. It works under CP/M and functions well except that I have to set a carriage return delay to keep from loosing characters from the beginning of lines at 300 or 1200 baud. I loose characters when a line has to wrap around (ie. > 80 characters) or whenever a Ctl-G is received in spite of the CR delay. The termcap for a soroc terminal works (TERM=soroc) for everything else but you can imagine what the screen looks like when I try to use vi. Microft says the Apple 80 column card is too slow. Is this a classic case of finger pointing? Does anybody have a suggestion to solve this problem? Is there a faster card somewhere? If so does anyone want to buy a used Apple Extended 80 Column Card?

3) I've been using the AZTEC C compiler for over a year now. I've transferred programs back and forth from home to work (work=VAX 11/780, 4.2bsd or PDP 11/70, V7) and only found one problem with the AZTEC library. There is no "isalpha" in it. Since both "islower" and "isupper" are present it's not really a problem. I'm very impressed with it's degree of UNIX compatibility.

One thing the others didn't mention about the AZTEC compiler was the fact that IO redirection (ie. '<' and '>') is built in to any programs compiled with it. This is a mixed blessing as far as I can tell. A little bitty program that just says "hello world" with a simple printf generates a relatively huge .com file. There has to be a way to get around this redirection code but I haven't figured it out. Does anyone else have a clue?

Sorry if I got a bit verbose. I'm hoping to get some helpful responses from this posting and I wanted to make sure all you wizards out there had enough information to help me.

Apple has a Certified Developer program for Macintosh
and Lisa (and one for //e & ///) developers. There is no
charge for joining the program. Certified Developers are
elegible for substantial discounts on Macs and Lisas; for
example, a Macintosh w/ printer costs $1667; Lisas are
discounted about 30%. Delivery is quoted at 3-4 weeks.
Systems cannot be resold for one year and must be used to
develop products which will be resold for use on Apples;
there are some restrictions on the number of systems you can
order.

This has been touched on before .. but the Apple //e 80 column scroll is too slow for 1200 baud operation. Some terminal programs (like Ascii Express 4.2) get around the problem by writing their own screen code. With CP/M you have to rely on the ROM code I guess. One rumor I've heard is that Apple will be coming out with a new set of ROMs to significantly speed up screen scroll on the //e. Another thing you may want to do is to buy an 80 column card with hardware scroll capabilities and put it in slot 3.

I am presently using the SPICE program running on the vax.
I have access to the vax through a 300 baud modem, using an
Apple // computer at home.

I am interested in obtaining software, running on either the
vax/unix system or on the Apple, which will display the
SPICE output graphically on the Apple.

I would like to hear any comments on the availability, feasibility

existence (commercial or private) and any useful hints on this
topic from you.

    please reply by mail

                              Thanks in advance,

   Does anyone have any info they can lend me about using a software
package called "ASCII Express" with a Robotics password?
   I currently have a "Perisoft RS-232 interface in slot #2
of an Apple II+ and have set the ASCII Express options for using
the Hayes SmartModem as the protocols seem to be the same.
   My problem lies with the inability to dial out through the
Password Modem.

   Any help or advice would be appreciated.

... too many piracy flames in net.micro ...

How 'bout thinking the fun we'll be having in a few years?

With microprocessor prices going down, and more computers floating
round, the impetus seems to be towards putting lots of them together.

How about distibuted systems based on, say, the AppleBus? If a
company (school, ...) buys one copy of some program and puts it on
their 30 Mbyte file server connected to twenty MacIntoshes, what

should they pay? The fee for one home Mac is too low ... but probably
twenty times that is too high.

Developers could charge a rate dependant on the number of users,
or how much the software is used, but how would that be enforced?

Any takers? What would be fair?

Apologies for posting this to the net, but can't get thru to intended
recipient today...

To: decwrl!decvax!harpo!ulysses!gamma!pyuxww!pyuxhh!kurt
Subj: Apple //e termcap

Unless Apple have made major changes, the //e ought to look like a Soroc
IQ-120, just as the][+ does. Hope this is some help. I don't have the
termcap you need - if you find it, I'd very much like a copy also.

Thanks.

Cheers,

Dick Binder

I are looking for information on C compilers for the apple][e
I have heard of ?astek? c but have no information or
idea how good/bad it is.

Please mail to me ihnp4!pyuxhh!kurt any info you have on c compilers
for the apple][e and I will post the results to the net.

The following is a nice little assembly language program that demonstrates
the power of the subroutines built into Applesoft.

It wwas written with a SC 4.0 assembler. Any opcode starting with a '.'
is a pseudo-op built into the assembler. You'll have to consult your own
assembler manual to find the proper translations.

.BS = block storage. Set aside the number of bytes specified (.BS 16 will
set aside 16 bytes)
.HS = Hex string. The bytes following the op are to be stored as a hex table
.EQ = Equate set variable name to a location
.OR = Origin. Set begining of program.

The program: 'Linear1'

```
1000      .OR $0800
1010 X1        .EQ $04
1020 Y1        .EQ $05
1030 X2        .EQ $06
1040 Y2        .EQ $07
1050      .EQ $08
1060 TEMP .EQ $09
1070 EX1  .EQ $00
1080 EY1  .EQ $01
1090 EX2  .EQ $02
1100 EY2  .EQ $03
1110 HGR  .EQ $F3E2
1120 SETCOL    .EQ $F6F0
1130 HPLOT     .EQ $F457
1140 HLIN .EQ $F53A
1150 RANDOM    .EQ $EFAE
1160 *--------------------------

It is a fact that many successful software firms already have
faced the problem of multi-user software. Several of which I'm
aware have sliding scales, along the lines of:
     1 user        $x
     2-4 users $2x
     4-16 users    $3x
     16-100 users  $8x
etc. (Number are examples only -- I dont remember any company's
exact pricing.)
The need arises from time-sharing systems, but I don't see any
fundamental difference from the networked software example. The
big problem is counting "users".
In particular, how do you restrict users on the system who won't
want to use the application (therefore you don't want to count
them) so that they CAN'T use the application. This is a question
that the software vendors consider important, and
that will become more important as time passes.

I have submitted to net.sources a simple Tektronix 4010
terminal emulator for the Macintosh, call it MacTek.

The program DOES use the cross-hairs. It works on the tools I commonly
use, but I made no attempt to adapt it to all 4010/4014 plot-10
software. I stressed utility rather than completeness, as it runs
slow enough with Microsoft BASIC.

The Tektronix mode runs at about 300 baud, it XON/XOFF handshakes,
so you can use your 1200 baud modem. From what I here about
MacBasic, it could be rewritten to run at 1200 baud, with maybe even a
couple more features. And.. with a REAL language like 'C', well..
needless to say, I can hardly wait!

A scrolling ALPHA mode exists as well, as that mode is faster for
text work, and you don't have to clear the screen all the time.

Notice that the basic character I/O routines are from the MacTEP
program posted earlier.

If you are using MacTEP on a UNIX 5.0 (UNIX V, all TM BTL, of course)
you can get much better 1200bd performance by replacing lines 4030-4080 with

if loc(1) <> 0 then print input$(loc(1),1);

This also requires that, once you get through a rather noisy login, you do

stty -parity -onlcr

to get the tty driver to behave appropriately. The Microsoft interpreter
is simply too slow to keep up at 1200 bd going a character at a time.

Good luck with your Mac...

My two teen-aged sons have been coming home raving about the 'new'
Apple IIc. Can anyone tell me about it?

We are going to be in the market for a micro this summer and I was going to
get a Mac. The purpose is to allow my budding hackers to really get into
computers. I am beginning to question the Mac's ability to do this.

Does anyone have info on the Apple IIc? Does anyone have an Apple IIe
configuration for sale?

Tonite I assembled a IIe with single Apple drive for
my wife's elementary school. Later someoe told me
NOT to apply the U-clamp to the cable AND the metal
tab (as shown in the Apple book) but only to the metal
tab. He said tha, when he assembled it as in the
instructions, he pinched the cable, shorting two wires
and "blowing a chip" on the drive PCC board.

Can anyone confirm or deny this? And quickly, if
possible.

Thanks,

Brint Cooper

The following termcap for Apple][/Soroc 120 was supplied by the two people
named underneath. Haven't yet tried it, but it LOOKS reasonable.

*****

```
MI|soroc|Soroc 120:\
     :cd=\EY:ce=\ET:cl=2\E*:ma=^K^P^R^L^L :\
     :kl=^H:ku=^K:kr=^L:kd=^J:tc=adm3a:
```

With sufficient care, no damage will result to the cable when clamped
according to directions. The change from the Apple II/II+ procedure
(metal tab only) results from more stringent FCC requirements. If you
don't care about meeting the requirements then any method of grounding
the shield will do.

does it perform and is it compatible with the previous versions ?
Is a directory translation program provided either with Aztec
or Pro-DOS ? What clock (if any) are you using ? How much does
the Pro-DOS version cost and do they have an upgrade price ?

The possibility does seem to exists, if you aren't careful. My dealer's
service shop warns about this. The problem is minimized if you are
careful to avoid overtightening the clamp and make VERY sure the cable
fits into the small space provided along the edge of the slot. It is VERY
easy to get the cable pinched because it is VERY hard to get it in correctly.
The tight quarters and short cable length don't help, so you must have the
patience to back off and try assembly over again if it doesn't look right.
Of course, if you already have it installed, and it isn't too tight, and it
doesn't look pinched or installed crooked, and it works, you are probably
safer just to leave it alone...

The Apple II series drives seems to have alot of problems which lead to
blowing the driver chips on the disk controller. This includes the problem
of pinching the wires as well as, more commonly, a connector which is
improperly inserted (backwards, off by one row) or one which is partially
pulled off by tension on the cable. Perhaps the solution is to carefully
follow the Apple instructions for assembling the disk drives.

     A gateway has been proposed between this newsgroup and the
corresponding ARPA mailing list. The result would be to increase traffic
a bit, and hopelfully divert some Apple traffic out of net.micro.

     To avoid excessive meta-discussion, how about if I ask for
objections to be mailed to me, and if I dont receive "a lot" of them
in a week, Ill install the gateway. Otherwise Ill re-open the issue
here.

[ask, and it shall be given]

I had a chance to try out MacPascal and MacBasic (a pre-pre-release version as far as I know) and I was very impressed. While the graphics were very nice, the thing that impressed me the most was the speed. A few simple benchmarks were run using MacPascal and compared favorably to the same programs run on a Sage IV. I realize that's not a totally fair test, since the Sage was running the p-system and MacPascal is interpreted (incrementally

compiled?) but it was still impressive. A few benchmarks using MacBasic ran approximately 3-5 times faster than the same programs on the IBM-PC and much faster than in Applesoft on my //e. One nice feature of MacBasic is that it doesn't require line numbers unless you are referencing a line with a goto statement. The MacPascal environment has a nice syntax checker and a sort of "pretty program" feature which will take care of indentions, etc.

My overall impression is that MacPascal and MacBasic are worth having (and waiting for.) I don't know when it will be available, how much it will cost, or any other details, and I don't know where the version I saw came from. None of the dealers around here have it, as far as I know.

Good things come to those who wait.

When groups like net.wobegon and net.suicide exist, it is hard to understand objections to a reasonable sub-group. Even if there are <10 articles a week, the split is useful. There is an extreme division between old Apples and Apple 32s. It is frustrating and time-wasting for those of either persuasion to have to wade through articles of the opposite persuasion. You can't always tell from the title which persuasion the article follows, and many people don't know or don't want to put "(for Macintosh)" in their title. Some of us can only afford to read news on weekends, or for a few minutes during the week. Any time saving division helps. For instance, I would like to read net.unix-wizards more often, but it seems to be 75% BSD related. I have little interest and no expertise with BSD, and would welcome two subgroups here.

I assert that if the Apple 32 line were produced by a new company, that a net.micro.whatever group would have been started immediately.

I also predict that traffic about the 32s will grow exponentially
as the Macintosh orders start coming in. Few people have their
Macs yet, because the factory has been gearing up.

Is it really that big of a deal to give birth to a new sub-group?

munch munch
Last week I called Apple about the availability of MacPascal and MacBasic and was told that they will be some time off ("around third quarter"). I also asked about the rumored C compiler and got two comments - "around Summer" and "we can't comment on the release date of a third party until the product is released." Rumors are that MicroSoft will do the C compiler - pretty logical as they have Mac experience and a 68000 C compiler for their Xenix. Does anyone have anything more solid on this?

More things to wonder about -- What is the status of the DS Sony drive for the Mac? It is now clear that a special version is required and it is also clear that Sony is selling many more drives than they can produce. Is it worth it to go with the external SS Mac drive now (it would be essential for any serious playing around), or to hold out for a DS drive?

I believe that the traffic problem that they are worried
about with gatewaying INFO-MAC to Usenet is not the
volume TO Usenet, but the anticipated volume FROM Usenet
to the mailing list.

The volume of INFO-MAC is already huge. It seems to greatly
outnumber UNIX-WIZARDS, for example.

[]

I don't know when Apple plans to release MacPascal or MacBasic, but I've
seen (and used) both of them in the form of a pre-pre-release(?) version.
Both languages are fast and have excellent user interfaces, assuming what
I saw was representative of the final product. A few rather crude
benchmarks indicated that MacBasic runs 3-5 times faster than the
interpreted BASIC on the IBM-PC. MacPascal seems to be interpreted,
(or perhaps incrementally compiled?) but runs quite fast also.

I think both languages are worth waiting for.

Let me quote from the current issue of Apple Assembly Line, page 20, a short note written by Bob Stout, discussing ProDOS on a Franklin:

" The ProDOS boot routine checks to see if you are in a genuine Apple monitor ROM. However you can make it work.
Start the boot procedure; when meaningful action appears to have ceased, press the RESET switch. Get into the monitor and type 2647:EA EA and 2000G."

Good luck.

AAL, by the way, is available for $18/yr from S-C Software Corp., Box 280300, Dallas, TX 75228.

Once again I reiterate my plea for net.micro.lisa as the Lisa/MacIntosh newsgroup.

1. net.micro.68k is MUCH too wide

2. net.micro.apple is MUCH too irrelevant

3. net.micro.apple.68k is MUCH too misleading

4. net.micro.apple.[lisa,mac] is MUCH too constrictive

Come on! After a year or so of debate the machines are going to be obsolete! Naming the group net.micro.lisa (after "Lisa Technology" not the Lisa) puts the discussion in an area separate from the apple and 68k discussions and into an area where the REAL difference between these machines and all the

others is highlighted - I refer to their user interface and OS technology.

123 Skidoo
   I've seen Microsoft (?) MacIntosh BASIC on sale at a computer store
in Mobtreal (last weekend). It was listed at something like $200 CAN.
They also had multiplan. I guess the Mac software has arrived. Unfortunately,
they salesman told me they couldn't get any (enough) machines.

Please move this discussion of net.micro.lisa to:
        net.news.group
You would stand a much higher chance of getting another
group, as well as fa.info-mac

BTW, I would prefer net.micro.ap32
Apple is calling the Mac/Lisa2 family of computers the
Apple 32 Systems.

I have a question about Pascal 1.1 on the //e.

On the Apple II+, Pascal 1.1 has a 40 column display. <CONTROL-A> is
used to look at the right-hand 80 columns. I'd like to know if a real
80 column display is available on the //e (with an 80 column board).

The new version of Apple Pascal is out (version 1.2). Retail price is $250, update price (see below) is $75. If you have a II+ or IIe without extended 80 column card you get a bunch of bug fixes and ability to use the Profil hard disk. If you have a IIe with 80 column extended card 1.2 will use the auxiliary memory to allow you to run larger programs and edit larger files (edit 60 block files!). Once I get 1.2 I'm going to look into getting this "extended" version to run on other ramcards so that II+ people could get those benefits.

Have you ever looked at the intro disk for the IIe "Apple Presents...Apple" that takes you through the keyboard, etc, and does nifty animation? Well it turns out that it is all written in Pascal. From the directory listing and peek into System.Library it seems to be using a runtime version of Pascal and some homebrew graphics code (i.e. not turtlegraphics). Perhaps someone out there can look into it and find something interesting.
-dave

p.s. to get Pascal 1.2 send your APPLE1 disk plus $75 with name,addr, zip code to
Apple II Pascal Upgrade
P.O. Box 306
Half Moon Bay, CA, 94019

People who bought 1.1 after Dec. 1, 1983 get a free upgrade to 1.2. They s send a copy of their 1.1 sales slip.
You get 4 new disks plus a 1.2 update which describes the 1.2 additions and changes within 4-6 weeks.

;;; This is the directory of the "Apple Presents...Apple" //e disk.

I think lisa/macintosh discussions should go in net.works where
other similar products are currently discussed. Then, if there are
enough submissions to justify it we might consider creating
net.works.lisa.

I have used the old II+ Pascal on IIe's with the 80 column board. The
system automatically comes up in 80 column mode. The only problem we
have encountered is that the up and down cursor controls do not work
These functions still require the use of the old control-L and control-P

keys as in the IIe. On the positive side, the upper/lower case keyboard
on the IIe is a real improvement.

Some of Apple's technical people gave a demonstration and talk at
CMU and we learned a few things that may be of interest.

1) Apple has published a three volume set of Macintosh technical
documentation for software developers. It is being distributed
by a third party publisher who is being swamped by requests at
the rate of 150/day. The 3 vols are $150. Looking through the
three volumes, they document the ROM routines very well. These
allow the applications programmer to manage menus, windows,
graphics, etc. by rom calls which make his programming job
easier and assures that the user interface to his program will
look the same as all the other software for the mac. Of course
he doesn't have to use these calls, but anyone would be a fool
not to if he plans to market his software.

2) Apple is working on a K & R standard C (no UNIX, however) for
the LISA and one for the MAC that the person did not know for sure
whether would be K & R standard. The Mac version might be ready
in late 1984. He felt that Apple was evolving into C as the
systems language, whereas before it has been UCSD Pascal.

3) Microsoft has a VAX C compiler that compiles code for the MAC.

4) Sony has not yet successfully produced a double sided 3 inch drive.
Samples are expected this fall.

5) Tecmar has a hard drive that interfaces through the floppy port.

The up and down arrow keys on the Apple //e *can* be used in Pascal. It requires changes to the SYSTEM.MISCINFO file on the startup disk. See the Operating System Ref. Manual for details; it only takes a few a few minutes. There are other changes you can make as well, and they make the Apple Pascal language system much nicer to use.

I just saw the mouse for the Apple II+/IIe and was very impressed. It is essentially the same mouse as the Macintosh's, with a cable running into the mouse card which was installed in slot 4. The mouse card is supposed to have some ROMs on it that can be "easily" called to determine the position and status of the mouse.

Along with the mouse package comes a great graphics program by Bill Budge (of Pinball Construction Set fame) called MouseDraw (or is it MousePaint?) which really mimics the great Macintosh drawing program. It has icons, small pictures for menu choices, and it works in COLOR. It has about five nice character sets (unfortunately, not Old English) and is incredibly fast. It also has the "pull-down menu" system like the Mac which prints sub-menus when selecting main functions. It is also extremely easy to use - I figured out about 90% of the functions just by looking at the pictures and experimenting.

I asked the dealer about support for the mouse, and he CLAIMED that Apple was going to come out with 40 programs that support it. I asked him "Four zero?" and he confirmed that I did not misunderstand. Regardless of the number of

supporting programs, I was very glad to see that Apple was backing up its 1,500,000+ Apple II/II+/IIe with new products. (i.e. Mouse, Duo-Drive, ProDos, Profile for Apple II, new software, etc.) and that the II family is going to remain viable. Apple is supposedly going to announce its portable IIe in may. (IIp?) I wonder how many peripheral slots it will have... when I get a mouse I will have 5 filled up.

I also got a peek at ProDos, which was fast and had nice file structuring. I wonder if it will work with 8 inch drives and Corvus type hard-disks that are non-Apple. I commend Apple for making ProDos not work on fake, copycat Apples such as the Franklin that act as parasites on Apple's one-of-a-kind ingenuity. Yes - it will work if you change three bytes to NOPs, but it is the thought that counts.

In search of New Apple-ications.......

#N:inmet:17900013:000:1424
inmet!muller   Mar 22 00:50:00 1984

Question: How does one write a procedure to be included in a Units
library in Apple PASCAL to which you can pass a variable array (by
reference) such that the subscript range does not need to determined
when the procedure is written (i.e., variable dimensioning)? If you
list the procedure with its parameters in the Interfaces section of the
unit, and you give a TYPE (presumably defined in the as yet unwritten
calling program) as the identifier of the array, in order to make sure
the types agree between the calling program and the porcedure in the unit,
the compiler doesn't like it. If you then define the TYPE of that array
before the procedure declaration, you don't have variable sizing, since
you then have to declare the sizing variables, and the type statement has
to go before the var statement.
  In a related question, can you declare variables local to a single
procedure in a Unit by placing them in the procedure block rather than in
the Interface section? (Variable parameters are declared in the Interface
section, and not in the subsequent procedure definition.)
  Finally, in another related question, by what criterion does Apple
PASCAL think that two arrays are of the same type? Same element type and
same subscript range? or must they be declared to be the same type? and
if so then how does one pass a type to a Unit?
    Thanx,   Jim Muller   harpo!inmet!muller or ima!inmet!muller

You need to open your "Apple Pascal Operating System Reference Manual" to page 199 and read about system reconfiguration. Specifically, you need to run the program APPLE3:SETUP.CODE and change the values of the following setup parameters, as shown in the table on page 209:

Parameter name	default value	value for //e
KEY TO MOVE CURSOR DOWN	CTRL-L	<down arrow>
KEY TO MOVE CURSOR UP	CTRL-O	<up arrow>
HAS LOWER CASE	FALSE	TRUE
SCREEN WIDTH	79	80

You don't even have to know the ASCII codes that are generated by the arrow keys, since the program allows you to type the keys themselves in response to the prompt. One other possibly desirable change is:

KEY TO DELETE LINE	CTRL-X	DELETE

The problem with this last is a quirk in the operating system. On the //e, the ASCII DELETE is a PRINTING CHARACTER (it makes a checkerboard pattern which is used as a cursor by Apple DOS, but not by Pascal). The Pascal system, however, thinks that DELETE is a nonprinting character. The result is that when you delete a line using DELETE, it appears that one character is still there (but it really isn't).

There are two possible solutions to this dilemma, other than forgetting about DELETE:

1. Figure out how the system tables work and patch the system to make DELETE a printing character. There are some hints dropped in the manuals, but it is not clear-cut. I didn't go this route, because of:

2. The Modula-2 System from Volition Systems provides (among other things) a patched version of the system that recognizes DELETE as the "delete line" character and handles it correctly.

It appears that the only way (right now) to get the Quickdraw Manual is to
get the Macintosh documentation manual called Inside Macintosh. This is the
$150 800 page magnum opus that has been previously mentioned in this
news group. For an extra $100 you get the next update of the manual as well
as development software and updates to that software for a year. I don't have
$250, but for those who do:

         Apple Computer Inc.
         467 Saratoga Ave. Suite 621
         San Jose, Calif. 95129

Hopefully we'll see a separate Quickdraw manual or (hint, hint) someone will
share goodies from the Inside Macintosh documentation with us.

Any more information on the C compiler? I have heard conflicting noise on both
developers and release dates. It will be nice to get away from Basic.

I stopped in to pick up my MacSack the other day (7 weeks delivery),
and chatted about other Mac options. Pascal - soon? not yet, anyway.
MacTerminal? - no word (I SURE WOULD LIKE THIS ONE) The salesman
pointed out that they had Basic from Microsoft (but not one to sell).
He said he was very disappointed in the Basic, since there was only
18K left for workspace ... is this TRUE? What will happen with
Pascal? Is this thing useless for programming until the 256K chips?

I would also like to hear about any other software that is available
(as opposed to announced), especially in Frostback land (Canada).

With a little experimenting, I've modified the line drawing routine
used by Applesoft. Believe it or not, it is VERY relocatable, so I

moved it to RAM and modified both the line draw and the plot routines
to be exclusive-or instead of destroying background. This allows you
to produce programs that use the 'rubber banding' effect that has become
so popular in user-friendly software as of late.

If there is call for it I will gladly post the modifications and instructions
unfortunately, one must poke in the arguments and do a call, but with a
little work, I may have so that it uses either the ampersand or the usr
commands (probably ampersand).

It is extremely dirty to use variably dimensioned arrays AT ALL in Pascal.
The only way I know of is to declare a pointer to your array type declared
like this: array[0..0] of whatever; If you turn rangechecking off (*$R-*)
then you can access all the memory you want. In this case, you should
then pass the pointer and the dimension to the unit procedure. Be careful
of stack overflows.

You may declare variables, procedures, and functions local to the
implementation section of a unit.

I believe that variables must be of the *exact same* type to be equivalent.

If you need more help, mail me.

I've had my Macintosh for about a month. It continues to be great. I have found only one bug in the last three weeks, its very obscure and in MacPaint. The most frustrating thing about the mac is speed. The applications take time to start up, the disk seems to be the bottle neck, I presume that more memory would solve this problem, I wonder if I wouldn't rather have the second drive be ram disk. It isn't really slow compaired to other floopy based systems its just that I value those few moments every day that I'm willing to work very highly and I hate to watch them dribble away.

  The applications are a real pleasure. It is a rare moment in computing when you aren't regualarly irritated by some boundary condiditon in the software. MacWrite really grows on you, I wish for a little of the vi/emac kind of power but the mouse is so zippy that I rank MacWrite is a close second to vi in my ranking. As a formater it isn't Scribe but it comes close on the user friendly axis, on the archecture axis is isn't much very special once you've gotten over the increadable power of the what you see is what you get feedback.

  MacPaint is magic. The author of this program is wizard, I don't think I've ever see a program this perfect. Its so smooth, no edges, so very accessable. And like scribe there is very substantail power hidden under that surface.

  The Microsoft spreadsheet is fine. It has all the limits of a classic spread sheet, I have a lot of trouble viewing the universe as one giant array. The user interface is everything it should be, Apple has set a good example and Microsoft didn't blow it. I've found a dozen or so little nits in it, mostly off my one problems, I don't believe they let enough talented users beat on it, and the author wasn't an artist but a competent hacker. The manual doesn't exactly agree with the implementation either. If your trying to sell this to a spreadsheet user then the user interface should do the trick, it is very easy to use.

  I have used the Microsoft Basic for a few hours at the store. It's fun but I can't bring my self to buy a basic for a whole mess of money. It takes it about 20-30 seconds to draw a thousand lines on the screen, I'd quess. I don't

think you could write an game in it that moved sprites about the screen.
  The microsoft programs maybe copied to another disk, and run from the copy but a copy will always request that it see you master disk as it starts up, what a pain. It only needs to see the master the first time you start it up in the day, if you never turned the machine off this wouldn't be such a problem. There does not seem to be any copy protection on the Apple software, but then it may know the serial number of the machine some how, I doubt that since the hardware design doesn't seem to admit that as an option.
  I heard a funny story about some guy who'd gone to an interview at Microsoft. It seems they have this section of the building all boarded up for Mac development work, paper on the windows, locks on the doors, etc. The guy he went out to lunch with from that group allowed as he hadn't been out of the building in a month. The master Multiplan disk has all these 2:00Am, 5:15Am, Jan 30, 1984 dates on the files.
  I would very MUCH like to see a Macintosh notesfile. I want it called net.micro.mac, since it is cute. Could one of our fine ARPA net gateways step forward and plug us into the Flames from the white tower network, please?
              Ben Hyde, Intermetrics Inc, Cambridge, Mass.

To R.L. Caroll and others:

In answer to inquiries o using ProDos on a copy-cat Apple, I am reposting informaton in a previous letter. Boot the ProDos disk and when meaningful action seems to have ceased, press RESET, go into the monitor (call-151), type 2647:EA EA and 2000G. I am taking someone's word for it that it works.

To get the up and down arrow keys to work in Pascal, use the configuration program on the third disk. It works fine (at least mine has).

I ran across a little Mac trick and am sharing it with the net.

I was performing a series of long calculations, the kind where a
programmable calculator is nice. The Mac works great as follows.

Open the note pad to a clean page on one half of the screen,
and open the calculator on the other half. Type in the normal
keystrokes you would enter on the calculator into the note pad.
Don't enter a RETURN unless you want the calculator to beep at you.
When finished entering your equation into the note pad, highlite
it with the mouse and copy it into the clipboard (COMMAND-c). Move
over to the calculator and paste the clipboard into the calculator
(COMMAND-v). Watch the keys go, and walla the answer.

Ahh, now you want to change your equation a little, simply edit
the note pad, copy it into the clipboard, then paste it into
the calculator. Thats it!!

MacNificent Mac

Re: Mac Quickdraw (and other firmware doc)

Apple has a document available to "approved developers"
(whatever THEY are; fill out the forms and take your chances)
for $150. You'd think they'd make it available cheaper to
those schools that bought lots of them; maybe they figured that
if the students can't hack, they'll work on homework instead? :-)

For the rest of us, we'll just have to settle for the McGraw-Hill
and Howard W. Sams "interpretations" of Apple's manuals.

[Burp!]

I just a purchased a Mac (I have to wait at least two weeks before delivery, darn it!). My questions has to do with the two BASIC packages available for the Mac.

Has anyone seen MacBASIC and can tell me the difference between it and Microsoft BASIC?

I know Microsoft is going to cost me about $150. Anyone got a price and/or due date for MacBASIC?

Any chance of either BASIC being compatible with the version that runs on the Apple II+ or IIe?

I would really appreciate any help before the Mac arrives. I have to start cranking out BASIC programs ASAP.

Thanks,

Scott D. Allen

I have altered my apple pascal software to recognize the up and
down arrows as discussed in some of the recent news items. But
now if I accidentally do a control-O the screen goes into reverse
video and there does not appear to be a way to put it back to
regular video without resetting the apple. Any suggestions?

A good source of information for Pascal <-> DOS 3.3 file transfers is the book "Beneath Apple DOS" by Don Worth. There is a companion book and disk called "Bag of Tricks" from Quality Software. The disk contains a program which can do the transfers, but it is not extremely convenient to use, since the file transfer is only a side effect of the program's main purpose, which is to examine disks and display raw data, make patches, etc.

There have been file transfer programs in various magazines. I don't have a reference in front of me but I can dig one up if anyone needs it. I have never seen the need for Pascal <-> DOS file transfers myself, since I don't use DOS for anything but the most trivial purposes, but I know what is involved.

Basically, you need to use the lowest-level disk routines (Pascal's "unitread" and DOS "RWTS") to read the foreign disk. The trickiest part, if you want to program it yourself, is figuring out how to map Pascal "blocks" into DOS "track/sector" addresses. The two systems use a different interleaving scheme, which largely explains why Pascal disk operations are so much faster than DOS. This is detailed in "Beneath Apple DOS," which also describes the Apple CP/M format (yet another interleaving scheme).

You also need to decipher the directories. The DOS directory is located on track 17 (11 HEX) and is well-documented in the Apple manual. The Pascal directory is on blocks 2-5 and is not so well documented, but I can post a description if anyone needs it.

  The ProDos "fix" that was proposed not only does not work for
  me (2647:EA EA), but seems to
  be patching only the first 2 bytes of a 3 byte inst'n to
  NOPs. Oh well.

To correct my earier posting, what I had heard was that ProDos
  was incompatible with non-std disk cards. One person
  has responded that it worked properly with his clone. On the
  other hand, it won't work with mine even though I have never
  had trouble with any other software.

I could understand apple making the software check to ROM to
  cut out the clone makers, but it does not seem sensible to
  insist on a std disk card. I would presume it is
  acceptable to Apple that their users buy third party
  peripherals.

I have posted to net.sources a copy of the C source for a program
which reads the Mountain Hardware CPS Clock (in slot 5, but easy to change)
and produces output similar to the UNIX date command (but with no
formatting arguments permitted).

This code should work with some modifications with other clock cards,
if anyone modifies it to work with others, please post your results
to this newsgroup and send the source along too.

I am selling a 300 baud Micromodem by Hayes
    It is the Micromodem //e (better than the older one), but is can also be used on the apple // and //+. It is compact, consisting of a board that plugs into an expansion slot and a cable that goes direct from that board to a telephone jack. It has a built in speaker, so one can hear whether the line is busy, a person has answered, etc. It comes with a manual and free subscription to the Source. I got it in early January, so it has hardly been used, but I have cquired a 1200 baud modem. It lists at $330. I am asking $248.

If you don't want CTRL-O (? - I thought it was CTRL-E or CTRL-R) to toggle reverse video, then run the setup program again and set HAS LOWER CASE=TRUE.

Also, be sure to set the screen width to 80 instead of the default 79. You
will see a dramatic difference in the displayed prompts and in the "E" display
from the FILER.

I am looking for termcaps for a
apple][e using the CCS 7710D
modem card (and 80 col. card).
I have several, but none work
with vi.

Also, I just got a Mc and was
wondering if anybody has termcaps
for it yet (also to work with
vi).

There are two ways to put your Apple into inverse video mode from Pascal:

1. This seems to apply only if you are running with HAS LOWER CASE=FALSE
   in your SYSTEM.MISCINFO. This is the default value and is appropriate
   for an Apple II+. Inverse video can be used to represent upper case
   letters, with normal video for lower case. On the //e, this mode
   should be disabled by running SETUP and setting HAS LOWER CASE=TRUE.

2. This applies if you are using a //e with the Apple 80-column card.
   If a program writes CTRL-O to the CONSOLE:, it enables inverse video.
   To turn off inverse video, send a CTRL-N. These codes are not
   operative if typed in from the keyboard; they must be written by
   a program. (Possibly the program echoed back what you typed?)

> 80 column display is available on the //e (with an 80 column board).

With most 80-column boards, Pascal 1.1 will automatically turn on the 80-column display at boot time. I am typing this on a Pascal communications program running on a 128K Apple //e with Apple's extended memory 80-column card. The 64K version works the same way. At least some third-party boards can work with Pascal on both the //e and II+.

Some of the third-party 80-column boards might have trouble. I understand that some early versions of the Videx Videoterm had faulty ROMs which caused some Pascal functions to hang, but that has supposedly been fixed. If you get stuck with one of the old ones, you are supposed to be able to get an upgrade from Videx. I recall reading that most other 80-column boards that are //e compatible will work with Pascal, but I don't remember which ones didn't.

Incidentally, rumor has it that Pascal 1.2 is now available from Apple. One of the things 1.2 can do is use the full 128K, possibly turning the other bank into a RAM disk. The upgrade is apparently $75 plus your APPLE1: disk from Pascal 1.1 (or FREE if you bought Pascal 1.1 recently enough).

Why doesn't PRODOS work with non-apple disk controller cards?

WELL. You see, apple has been losing money to Franklin, and they
figured that, as long as they were intoducing a new OS, they
might as well make sure it would work on their hardware but
not Franklin's. You got caught in the middle (pretty much as they intended).

Whenever the //e screen is sent a control-O or control-Q strange things
can happen to your screen (i.e. it can turn inverse or into 40 column
mode). To fix the //e without rebooting go into the filer and type
control-n (this sends a control-n to the screen which fixes things).
I believe that pascal 1.2 might fix this annoying bug/feature.

This is a review of the contents of INFO-MAC for the period from
March 10th thru about half of March 15th.   enjoy ben hyde
Pricing:

"Having just worked on a project to sell a uP data-logger we have found that a 3x mark-up will insure about a 20% profit after taxes." glenn at su-shasta

Universitys:

- "... 500-600 people ordered Macs ... at Mich..." Jerry Wallis (Wallis @ sumex)
- "This is second hand and might not be accurate, but the word here at UT-Austin was that 2000 people snapped up tickets to buy Macs and/or Lisas on the first day. My ticket was numbered 1536 but I don't know where the numbering started. The scheme here is to stand in line to get a ticket that allows you to return at a later date (and at a specific time) to order a Mac. My date is March 23. You plunk down your 20% when you order and bring the rest when you pick up the machine.
- "We have recieved 700+ orders for Macs, and delivered the first 100 or so. But the predicted delivery of 300 more in March and 100 a month thereafter should be understood as our quesses, and not as information based on any promises from Apple." William Sholar <SHOLAR@CMU-CS-C.ARPA>

Other:

- Christopher A Kent (cak@Purdue.ARPA) feels that at $1200 the mac is a pretty good terminal, "won't threaten anyone's mainframes, but it should be able to make using those mainframes a bit more friendly."
- Much discussion about in different modens with Macterminal. Seems that Hayes compatable autodial modems should work fine.
  > "The Apple Modem is a repackaged USR Password. While Apple claims that they have made special modifications', I am reasonably certain that the instructions set remains essentially unchanged. This would mean that both Password and Hayes Smartmodem are OK."
  Michael Tchao <TCHAO@SU-SCORE.ARPA>
- Rumor of an upgrade problem for an old Lisa upgrading to a Lisa 2/10, no problem with upgrade to a Lisa 2. "timing incompatiblities on the mother board... any one .. successfully to 2/10 ..?" John Shore <shore@NRL-CSS>
- Talk of stacking add on boxes under the printer, over the monitor, worry about vibration, shipping box for add ons, standard peripheral footprint and roof...
- "I really only want one peripheral: a wire going to my local net, providing modem, printer, large-scale storage, and communication."
  Matthew J Weinstein < matt@UCLA-LOCUS >
- "...Big Blue released a 'portable' computer weighing 30 pounds whereas the 'non-portable' Mac weighs in around 20. ..." eugene miya <emiya@ames-vmsb>
- "purchased an insurance policy .. regular ... agent ... Aetna ... $100/year for $7000 coverage ... in home or not ... had to make up list of purchase price or replacement value." Mike Ciaraldi <ciaraldi@Rochester.ARPA>
- A report that a poor fellow discovers that his refrigerator makes the line voltage drop below 100 volts, his Mac was going haywire several times a day, disks lost, he now unplugs the fridge.

Queries:

Generate Music from basic?

General Gimics:

- shift-command-1 ejects disk... at all times ..." if the drive does not contain a disk, the eject mechanism is exercised. There doesn't seem to be any harmful side-effects, since a dialog box asking for the disk is displayed as soon as the disk is needed ... might help in situations involving a physically write locked disk."
  Mike Schuster <Mikes@cit-20.arpa>

MacPaint Gimics:
 - On problem of pasting large images into MacWrite from MacPaint
     > you can do physical cut and paste latter,
     > you can insert whole pages in the final document
     > you can, but its hard, cut out vertical peices and line them up
       in MacWrite. This is hard since cut/paste isn't perfectly accurate
       about the boundaries.
     > You can shink, cut, paste, and expand, but this loses information in
       the shink step.
Bugs:
  > ".. demonstration disks were broken ... power cycling ... to get out
    of boring demonstrations ... leads to unusable diskette." John Palevich

Brand new APPLE II monitor (monochrome) for sale.

This monitor was part of an APPLE II package deal,
although an AMDEK Color I monitor was also purchased.

The monitor is still in the box and a one year warranty
is included.

Should work with other systems.
Asking $175

A new magazine about the Macintosh appeared at my local Apple dealer
this week. The name of the mag is St.Mac (good grief!). It is
published by Softalk Publishing, which might explain the "St".
I can't say that I recommend the mag, although I haven't read
the whole thing. The publishing quality does not even compare to
Macworld. St.Mac features such useful articles as:
     "A Day in the Life of a Hawaiian Lisa"
Need I say more? However, if you own a Lisa or Mac, they will
give you a free trial subscription. I'll give it a chance,
although a friend of mine didn't think it was worth the effort
of filling out the card!

I don't understand why you don't ask your dealer to supply the
documentation that you are missing. Remember that it is illegal
to make copies of Apple Computer's copyrighted documentation.

Apple products are only legally available from authorized dealers.
If you did not buy Apple Pascal from such a dealer, you have no business
asking anyone for documentation to which you are not entitled.

Does anyone know of a way by which the composite output from a][e
can be converted into RGB signals for injection into a monitor?

Also - where is a good source of getting apple specific chips -
ie the][e's memory manager and things of that type...

Please reply via mail...
         And of couse, thanx in advance....

--Feb 10, 1984----------
We have all read the news reports, the reviews, the interviews. Most of
us have even seen the Macintosh in real life. It's a wonderful machine,
a monument to American technology and inovative design of both hardware

and software - but is it useful to any of us?

In one word I would say YES. I wouldn't even hesitate. It's simplicity of design and function makes it one of the shining stars in the microcomputer field. I have never read any of the Mac documentation, although I'm told that it is quite good. Yet I was able to use the Mac without any problems - able to use the word processor, the drawing program, etc. I'm even convinced that my parents would be able to use it within one half-hour period. Bravo for Apple and the Mac design team. There is, however, the question of the machine being useful - I mean really useful.

Software is this machines failing - at least for now. The Macwrite program is cute but it would be no good for me. I write long papers - I mean real long. I need a more industrial power wp - not a high school project preparer. If you are considering the MAC for serious word processing than I strongly suggest that you HOLD off for Microsoft's WORD for the MAC.

I think that the Mac will prove to be a popular machine. It's a bit pricey for most people's personal budget, though. Although the MAC/LISA/STAR working environment (icons, etc.) are attractive to many people, others, like myself, find this method of communicating with the machine distracting.

Have my views been perplexing - confusing - probably. You see - I like the Mac, but I don't think it could be a machine I could use a great deal of work - for programming, etc. Perhaps in time the software support will prove my point wrong - perhaps not. I would like to add that I don't think that the Mac will pose a very strong threat to IBM's share of the market - and certainly not to PCjr's - or Commodore's - or Atari's. Mac's too expensive for the later three. As for the PC and XT - well they are good vanillia - open-ended systems with a tremendous following - both in software and hardware. That's alot to give up for a cute machine - even though it has a great processor and nice graphics. I hope Apple fares well in the micro wars only so that some of the minds behind some of Apple's most recent accomplishments may have room to grow and produce more.

You know, I was thinking. If you want to try to implement a Smalltalk system on your mini or mainframe computer, but you don't have good graphics terminals, you're in big trouble. Either you fake it on non-graphically oriented terminals, and the system crawls along (which I suspect it might do anyway), or you spend a big effort ripping out all the window stuff, graphics, and mouse junk out of the Smalltalk environment you bought from Xerox, and add in your own character output routines (I think Smalltalk paints characters), and end up with something not nearly as useful.

So then, I thought, might a MacIntosh (or perhaps a Lisa) have its terminal emulation software set up so that the full desktop environment is controllable from the outside? I suspect that even if the answer is 'yes', there will be problems, for example:

>From what I have seen, I suspect the MAC implements menus and their interaction with the mouse in ROM. However, I suspect that there is a Smalltalk class 'menu' which is somehow implemented (as a subclass?) in terms of the class 'window', and that the mouse is somehow automatically monitored by those objects as well.

So, I am sure that the match would not be perfect. But can anyone enlighten me on my original question?

Gary Gladstone
U of Waterloo, Ontario

Gary,

In respone to your net querry,
I use ASCII Pro Express on my Apple II+ with 300 bps
Hayes Micromodem. I set ASCII Pro Express to emulate
a vt52 and use the following termcap:

```
apple|apple II running ascii express pro--vt52:\
        :bs:\
        :co#80:\
        :li#24:\
        :up=\EA:\
        :nd=\EC:\
        :ce=\EK:\
        :cl=300^L:\
        :cd=\EJ:\
        :ho=\EH:\
        :cm=\EY%+ %+ :
```

Hope this helps!

Regarding the Apple University Consortium:

According to Computer Systems News (national trade newspaper), the Macintosh and Lisa systems will not be available at the academic discounts until late this summer.

Comment: That's a long time relative to the competition to be announcing a price/product point. The strategy with such promises usually is to stall potential purchasers of competitive equipment. But the last few years shows that not even IBM is to be believed in their solemn promises of what, when and how much.

The optimal economic arrangement would be to price the same computer proportionally to the worth to the consumer, rather than a fixed price for all customers. That's what the airlines approximate with their artificial travel restrictions on budget fares.

Unfortunately, the US law says you have to sell identical manufactured goods at the same price to everybody, no matter how the utility of your product varies among your customers. One of the few legal schemes to get around this is to sell computers at "academic" prices. The restriction is artificial, but it allows more computers to be sold to those who wouldn't buy at "regular" price, while requiring "regular" price from most of those who would be willing to pay more than the "academic" price.

While a 2MBit/sec serial port sounds good, how about a 250Kbyte/sec port --
or a 128Kword/sec serial port? You're not going to put "a card cage" out
there. (While main memory is only 500Kword/sec, this is for random
access, not a serial bit stream. Doing random access over the serial port
would slow it way down, away from "memory" speeds and into "disk" speeds.)
Also, this is "burst" hardware speed, assuming full speed DMA feeding it

continuously. Software overhead? What software overhead?

Also, if this port is really a Z8530, then it's only spec'd to go to 1MBit/sec,
at least in my data sheets.

I suppose everyone knows by now that Apple did a Smalltalk for the Lisa
(yes, I have seen Smalltalk actually running on a Lisa). If you're
interested, why not give your Apple salesman a call and ask when it will
be available and how much it will cost? It can't hurt . . .

... speaking of 1984.

Random Q's and A's:

Q: How much does Lisa/2 benefit from Mac's chips and other internals?
Same ROMs, IWM, PLA's or anything?

A: Yes the SCC is the Zilog chip, perhaps "2 meg serial" should be read "2
1 meg serial", for indeed it does support 2 serial ports. (But is it a
pain to program!)

Q: Will there be an external hard disk for Mac, or is the disk port too Sony?

Q: Who is working on Un*x for Mac? A Blit emulator Mac?

Q: Can anyone describe the "...undisclosed proprietary technique for
phase-locking the 68000 to less expensive memory..."? Does this mean they are
doing software refresh? Or is refresh handled by the video DMA?

I know that there has been discussions about the Mac lately, but I just
HAD to add my two cents in.

FEATURES	APPLE MACINTOSH	IBM PC
Microprocessor	68000 (32-bit)	8088 (16-bit)
Graphics processor	Included	Optional
Standard RAM	128K	64K
Monitor	9-in. gray screen (built-in)	Optional
Resolution	512 X 342 78 dots/in.	Depends on above
Monochrome Graphics	Yes	No
Colour Graphics	No	Depends on monitor
Keyboard	Detachable typewriter-style	Detachable typewriter-style
Function Keys	None	10
10-Key Pad	Optional	Yes
Mouse	Yes	Optional
Disk Drive	1 3.5-in. microdisk	1 5.25-in. floppy
Additional Drives	Optional	Optional
Disk Storage	400K per disk	320K per disk
Output Ports	5 built-in	Optional

Base Price $2,495 $2,824

I don't know about you , but I'M getting a Mac.

Here are some answers to your questions.

[Anything in quotes is taken from "Apple 32: A Developer's Handbook",
draft 2/6/84 version 1.3]

> Q: How much does Lisa/2 benefit from Mac's chips and other internals?
> Same ROMs, IWM, PLA's or anything?

The Lisa 2 has "hardware advancements for media compatibility", which
means the incorporation of the Sony microfloppy. And, "operating
system and disk-performance improvements enable Lisa 2 Systems to load
and save documents 50 to 200 percent faster." The Mac ROM routines
that allow the Lisa 2 to run Mac software are not in ROM in the Lisa 2.
I have not read about any improvements to the Lisa motherboard.

> A: Yes the SCC is the Zilog chip, perhaps "2 meg serial" should be read "2
> 1 meg serial", for indeed it does support 2 serial ports. (But is it a
> pain to program!)

Between all the articles I've read, I've seen 1Mbit, 1Mbyte, 2Mbyte and
even 4Mbyte. But, in fact, you are correct. Apple says "1MBaud with
external clocking", and if one signal change is one bit, then 1Mbit
is correct.

> Q: Will there be an external hard disk for Mac, or is the disk port too Sony?

Hard disks are already in the works from Davong and Tecmar. It isn't
clear to me whether they are to use the external disk port, or one
of the serial ports. I would hope they use the disk port, since the
controller is already set up for that port, and the two serial ports
are *supposed* to be for a modem and a printer.

> Q: Who is working on Un*x for Mac? A Blit emulator Mac?

I'd like an answer to this one, too. As I understand it, unlike the
Lisa 2, the Mac was not designed to handle multiple processes. So, I
don't know if these things are feasable.

I am looking for a termcap for an apple II+ which only has a com
card and a 300 or 1200 baud modem. I would also appreciate the
termcap for this same set up adding a videx videoterm card. I will
appreciate any info I receive.

Reading the sack of articles that DECVAX recently sent us, I saw many questions about the Mac. Here are some answers/opinions: (First, my biases: I own an IBM PC; use an XT, Lisa, and Mac at work. The Mac is my favorite.)

Serial ports: AppleBus will run on one port at 230kb. The other port will run at a lower speed, such as for the Imagewriter. Initially, AppleBus will share disks and laser printers. You may run either port at a higher speed, if You can. The 230kb is all that is guaranteed to the unconscious programmer. (The nine pins are GND, +5, GND, TXD+, TXD-, +12, HNDSK/CLK, RXD+, RXD-. The +5 and +12 are signals; not for power.)

Imagewriter: The printer has about twice the dots per inch (144? vs 72?) that the screen does. Output will show jaggies if the fonts you use aren't available in twice the size that you use. (That is, if you use "12 point", the "24 point" font will be used for the printed output if it's there.) The output is good enough to send home to mom, though not as good as my (daisy wheel) Oligetti on my IBM. But the Oligetti don't do pictures ...

Single disk systems aren't bad for single applications. Having MacWrite and MacPaint on one disk with several documents is. The disks are a lot easier to swap than 5 1/4" ones - they don't bend. (Buy two drives.)

What would a college student do with a Mac? Most of our time-sharing use is word-processing; MacWrite/MacPaint would handle a large part of that work. By fall, more complete word processing packages will be available.

Mac vs IBM PC: a single drive PC (w graphics) lists for $147 less than a Mac (about the price of a b&w monitor and cable). A Mac gives you a lot less hardware and a Lot more design for the money. A PC comes without an OS, a Mac without a language. By summer, more Mac programs will be available than I will ever need - and MacPaint will Never be available for the PC...

Regarding the Apple University Consortium:

According to Computer Systems News (national trade newspaper), the Macintosh and Lisa systems will not be available at the academic discounts until late this summer.

Comment: That's a long time relative to the competition to be announcing a price/product point. The strategy with such promises usually is to stall potential purchasers of competitive equipment. But the last few years shows that not even IBM is to be believed in their solemn promises of what, when and how much.

The optimal economic arrangement would be to price the same computer proportionally to the worth to the consumer, rather than a fixed price for all customers. That's what the airlines approximate with their artificial travel restrictions on budget fares.

Unfortunately, the US law says you have to sell identical manufactured goods at the same price to everybody, no matter how the utility of your product varies among your customers. One of the few legal schemes to get around this is to sell computers at "academic" prices. The restriction is artificial, but it allows more computers to be sold to those who wouldn't buy at "regular" price, while requiring "regular" price from most of those who would be willing to pay more than the "academic" price.

>
> Q: Who is working on Un*x for Mac? A Blit emulator Mac?

In an interview Stephen Jobs of Apple said that Apple may
provide Unix workstation capability for the Macintosh. He also
mentioned a "disk server" -- a hard disk with a file mangament
software connected to a Macintosh network.

Possibly a "network computer" similar to the Sun Microsystems
and Cadmus products is in the works. Un*x for a stand alone
Macintosh is unlikely -- while a Macintosh is a fine personal
computer, the Macintosh hardware is unsuited to timesharing.

To amplify this article's point: What is the real market for the Mac?
I fear that it is to cutsy and of too limited a database capability
(i.e., slow rates through the external ports) for the business market on
the one hand and too expensive for the educational/home computing
markets on the other. I hope I'm wrong. In many ways it is a rather
beautiful machine.

I agree with all of you that Macintosh and Lisa/2 are neat and
snaz-ee machines and wonderful to look at on the inside. But
these are techy raves.

It will take more than a superior technology to defeat IBM...
just as IBM was capable of capturing the market with an
inferior technology.

Remember that IBM already has a huge client base and an even larger
VAD and retail/service network for its PC.

Technology alone won't save Apple... nor will it defeat IBM
(but we can hope and pray heh heh).

I am developing software for the Apple II/II+/IIe and I have an old revision 4
Apple II+ (1980) I am interested in getting a mouse to make a Mac-like,
icon-based menu system. Reports say that Apple is coming out with a mouse and
accompanying software for the II family (MouseDraw, or something)

There is a connector on the back of the IIe that looks suspiciously like the
Macintosh's mouse connector. Ten to one the mouse plugs in there. But -- I
only have a traditional joystick connector...

    Is it possible for me to get a Mouse?
    Do I need any special adapters?
    How does software read it - like a joystick?

Thanks in advance.

So who said anything about "timesharing"? UNIX does timesharing well but
it is available on a *number* of single-user machines, including (surprise,
surprise) Sun and Cadmus (as well as IBM, remember?). The Macintosh hardware
is unsuited to multitasking; I believe it doesn't have any memory mapping
hardware (the 8086 family (N < 80286) sort of has it, so you can fake it
well enough). Nor does the MAC have the hard disk that UNIX requires (because
UNIX goes to the disk so often, because the standard V7 filesystem used by most
UNIX implementations moves the heads too much, and because there's so *much*
of UNIX that you'd have to wrap your floppy in duct tape before putting UNIX
on it).

What are you talking about? I don't believe it is apple's
intention to "defeat" IBM. I believe that they want to compete
with IBM. They are not fools. Defeating IBM is an impossible task.
Apple has provided in the Mac an excellent alternative to the IBM
 so-called standard.

Then how does Apple get away with giving discounts to Certified
Apple Developers? Lots of companies do this!

Now, this is completely speculation on my part, but . . . could it be
that the reason that the educational discount won't be available
until fall is that by then Apple may be able to lower the list price
on the Mac -- say to $2000? After all, their robot factory should be
up to full speed by then. Perhaps at that point the "discount" won't
be so great (and perhaps the dealers won't be so upset).

Me personally, I'd consider buying one for $2500, if I had the money.
But by the time I do have the money, the discount program will have
started -- at which point I'll seriously consider making friends with
a Harvard or Boston College student . . .

(My alma mater MIT is currently not a member of the consortium -- no
doubt because of their involvement with IBM and DEC on Project Athena;
they're going to be up to their hips in IBM PC's and Pro 350's before long.)

 Is there a MODEM7 program available for the //e w/ 80 col., Hayes 1200
 with CCS serial board. I have a copy of modem7 but appartenly the
 80 col is too slow.

After a few hours hacking at the source of AZTEC's terminal dev-
ice drivers, I have succeeded in using a serial port (on a card
with no firmware) as the interface to the "console". Thus I can
use my CRT terminal. If anyone wants to know how to do this, let
me know. It's great have C, shell, ved, etc. running on my very
own Apple!

Has anyone out there written either a file transfer program
to/from UNIX, or a word processor designed for an MX-80? If not,
I plan on doing these at some point.

Brand new APPLE II monitor (monochrome - amber) for sale.

The monitor is still in the box and a one year warranty

is included.

Should work with other systems.

Asking $150

A while back I saw (probably in net.micro) mention of
a magazine similar to "PC Magazine" but concerned with
the Apple Macintosh. I would like some information
on this (availability). Please respond by mail, unless
the whole world will be interested in your commentary.

Thanks in advance (as we always say)

My wife is taking a Pascal course and she is using our Apple to run her
programs. Her instructor requires that anything that comes out on the
Monitor (With interactive programs) to be also printed on the line
printer. The only way I've been able to do this is by having to
write statements, one to the console and another to the printer. Is
there an easier way to do it? Maybe declare the file to two output
devices??

Daniel.

I own an APPLE II+ computer and I am interested in picking up some software
to generate Hebrew characters, and to play games based on Jewish Holidays.
Has anyone tried out any software, and/or where could I get some from?
Is it copyable?
Thanx for any help,

I need help in hooking a printer to my Apple][+.
I am planning on buying an Okidata 92 printer and hooking
it up to my Apple parallel printer interface card.
The manual for the Okidata says that the interface card
must have the P1 PROM in place for the printer to work
correctly. My card has a P9 PROM. I haven't found a
local dealer who has the P1. Can anyone out there tell
me where I could find a P1 and also maybe explain
what this PROM does.

Thanks in advance.

This follow-up is most timely. Last Purim I heard of an Apple program which displayed the Megillah for sing-along use. In keeping with the spirit of Purim, the program was supposedly repleat with sound effects and graphics (Haman actually gets hung). Does anyone know the source?

There is also someone in the Greater Boston area advertising Beginning Hebrew software. If there is any interest, I can track it down.

From: delphi::malik (Karl Malik ZK1-1/D42)
Subj; Accessing non-Apple format files

I have a commericial software package that writes non-apple format files to disk.

I'd love to be able to edit the stuff in the files but don't

know how to go about it. I can't LOAD OR BLOAD the files. I can copy them using FID.

CATALOG lists them as having V format (or was it X?). At any rate, it doesn't recognize them.

So, what I'd like is to be able to open the files, get a record from them, be able to perform operations on that record, and write it back to the file (or a new copy of it). To begin with, I'd just like to display the record in ASCII, so I can figure out its structure. (Can be done with BASIC or assembly)

Any suggestions? Any software available that can do this for me? I'm aware that there are programs that will dump disk sectors, but I'm not clear on how that relates to wanting to read records.

While I have programmed in assembly for other systems, I am still fairly naive about Apple concepts, so please spell everything out in long-hand.

All help appreciated.

,Karl Malik

Has anyone in net.appleland seen MACTERM running? In particular
I'm looking for the VT100 emulation and am not buying my MAC till
I know this works. According to a local comp. store MACTERM is being
beta tested and is due out very soon(like end of Feb.). It looks
very similar to LISATERM from the documentation. Has anybody found
any problems with useing the VT100 emulation on the LISA?

Thanks in advance

Thanks to everyone who sent in termcaps.
The following is a summary of the termcaps for an APPLE II
Apple][with smarterm
```
a2|apple|apple80|\
     :am:bs:bt=^R:cd=10*^K:ce=3^]:cm=^^%r%+ %+ :cl=15*^L:co#40:\
     :dc=^H:dl=3^X:do=^J:ho=^Y:li#24:nd=^\\:pt:up=^_:\
     :se=^O:so=^N:
```
I use ASCII Pro Express on my Apple II+ with 300 bps
Hayes Micromodem. I set ASCII Pro Express to emulate
a vt52 and use the following termcap:

```
apple|apple II running ascii express pro--vt52:\
        :bs:\
        :co#80:\
        :li#24:\
        :up=\EA:\
        :nd=\EC:\
        :ce=\EK:\
        :cl=300^L:\
        :cd=\EJ:\
        :ho=\EH:\
        :cm=\EY%+ %+ :
```

  Hello,
I am looking for somebody out there who knows A LOT about DOS for the
apple. He must know how the tracks are written and how to write

a program to read the tracks without using any existing DOS. He/She
must also know 6502. It would also help if you have written some form
of disk protection software.
 If you know anything about the above mentioned, please send mail to
me and i will send back. The project is to write a disk protection
program to be used on the apple.
 Thanks for any help anybody can give me...

          Josh siegel
        University of New Mexico

I just got an Appli-Card [CP/M(tm)] for my Apple //e.  I am trying to locate
other Appli-Card/Apple CP/M users who are interested in trading notes,
Public Domain software, "hints and kinks", etc.

I'd like some help please.

Somewhere out there in NetLand is a person happily using
an Apple running AE Pro with vi as an editor.

Could you please send me a copy of your tercap along with
any comments/hints you may have?

I'd be glad to post anything I get to the net as one article
(that is, if I get anything to post).

I send you my thanks (I'd send cash but it won't fit into the
coin slot on my terminal).

Irwin Seltzer

<- bug snack

There has been some discussion of pricing computer equipment,
both here and in net.legal, especially with regard to student
discount prices on the Apple Mac. Basically the question is "can a
dealer price a piece of equipment below list?" This is followed by the
companion question "can a firm (like Apple) make special arrangements

to sell their machines below list to schools/students?"

[The following discussion is based largely upon California law, and Federal law under the Ninth Circuit. Most States should have similar rules. Words I use below should NOT be understood like lawyer talk unless specially noted.]

A wholesaler must give relatively equitable prices to everybody. Variations in (wholesale) price must be based upon some reasonable consideration (volume discounts, for example, are okay if available to all, and not clearly unreasonable), or enjoy some classic exemption, like student discounts. Thus (question #2 above) university discounts on the Mac are okay.

A list price is a *retail* price, "suggested" by the wholesaler of a product to the retailers. In the computer business the wholesaler is often the original manufacturer. Due to anti-trust sorts of legislation, the wholesaler is forbidden to make the retailer sell the product to the public for a specified price, whether by requiring the retailer to sign a contract to that effect, or by refusing to sell goods to retailers that step out of line. Once a retailer has purchased some good from a wholesaler, he is free to set whatever price to the public that he desires. Thus (question #1 above) selling at less than list is okay.

Now, there are lots of reasons why wholesalers/manufacturers want to force a certain retail price for their equipment. The classic one has to do with the pressure from retailers who wish to maintain a large profit margin--they don't want price competition. As they can't lawfully prevent others from entering the retail business, they want the newcomers forced to adhere to the high price. This is bad for the consumer, though, so we get laws like those described above, making such (bad word here, but convenient) "syndication" unlawful.

The tactic in vogue lately for computer makers to circumvent the spirit of the laws and fix prices has been the "authorized dealer" covenant. The computer maker announces that "customer service" is an integral part of his product, and that only retailers who provide the right kind of service will be authorized dealers, and be eligible to purchase and resell the product. Anyone who tries then, to sell the product for less than list (consistently) is removed from the authorized dealer list for alleged service incompetence. This tactic is especially successful against low-overhead mail-order dealers, who are making profits from discounted merchandise as big as those that storefront operators are making from list price. Mail-order dealers clearly don't provide the kind of customer service (and education, et cetera) that walk-in businesses do!

Lately, I have learned of an even sneakier tactic, which I do not know whether or not has been tested in court. The computer maker requires retailers to sign a contract which explicitly notes that the maker may not set retail prices (other than *suggesting* a list price), and then goes on to require, however, that the retailer NOT

ADVERTISE any price less than list, under heavy contractual and tort penalties. This, clearly, is designed to discourage competition. First, it discourages a retailer from setting a discount price--he's free to do so, but since he can't TELL anyone about it, there's no point. (This produces some of those "call for price" ads that you see in the paper, I think.) Second, it discourages customers from going to a discount retailer to buy their computer (and thus making other dealers match that price to retain their clientel), because they won't KNOW there's a discount dealer in town. Absent knowing that they can save two hundred bucks by driving half an hour to wherever, they'll stay with the nice computer store up the street at list price!

I don't wish to make it appear that only computer manufacturers engage in these abusive practices: all businesses do. The fact that these kind of conspiracies are common, though, doesn't make them any less rotten.

I have had a chance to use LisaTerm, and the descriptions of MacTerm don't seem to fit. MacTerm is supposed to support XMODEM file transfer protocol, where LisaTerm (at lease the version I got to play with) had no file transfer capabties.

LisaTerm does emulate a VT100, and handles inverse, normal, underline, 80 col and 132 col. I suspect that the Mac will lack the 132 column feature although it is rumored that the National Optometric Lobby has approached Apple for this feature :-).

The only problem that I have had with LisaTerm (besides the fact that it is painfully slow) is that it does not handle the Insert/Delete Line/Character. Without these, it makes using some editors painful.

[]
I got a PCPI card recently after useing a Microsoft card for about 2 years.
There is a world of difference, not only from the speed (PCPI = 6 Mhz, Microsoft

= < 2 Mhz) but also from the way that the CP/M is implemented.

The PCPI card is also a much better hardware design, in my opinion. It always works with my Apple and its strange home-brewed periphs. I am presently trying to attach a prototype ram-disk made from Intel's bubble memories to the system.

Like George, I would also be interested in hearing from users of PCPI CP/M cards.

Please post to the net.

I have an Apple //e system. I also have an 8" disk drive (Shurgart, 801 I think). I would like to get an 8" disk controller card to hook the two together. I also have a CP/M card (PCPI Appli-Card[tm]) in my Apple.

Any recommendations?? Thanks very much.

Does anyone out there have any info on where I can get Apple
prototyping boards that fit in the I/O slots ? How much are they ?
How big are they ? All replies appreciated.

Can the discussions of the macintosh and the lisa be split off into another
news group? (I.E., a new one?) I'm interested in the M and the L, but I
have only epsilon interest in apple N widgets, etc.

Is anyone interested in an ARPANET/USENET gateway of the new ARPANET
INFO-MAC mailing list into, for instance, net.micro.mac? Enough traffic
already exists (and then some) in INFO-MAC. Gatewaying into net.micro.apple
is probably not appropriate.

If there is interest, is there a host willing to act as the gateway?

I also have the PCPI cp/m card and I am very satisfied with it. It works great
with my //e. However, I did purchase the 128K ram expander and used it as a
ram disk disk and had many problems with it. I ended up returning it from the
place where I bought it after talking to Nick and Gallen at PCPI. The problem
I had with it was that it would loose many or parts of my files.

Hi there. I have the following equipment:

- Apple][
- AIO Serial/parallel Interface (made by SSM)
- Hayes Smartmodem 1200
- Hayes Terminal program for Apple][(Says works with Hayes 300 & 1200)

The problem:

The terminal program cannot find the modem when the speed on the AIO is set to 1200 baud. It DOES find it when the speed is set to 300. Why?

An addendum:

> Occasionally, it WILL find it at 1200 baud, but I have to start the program up many times before it works correctly.

Additional information:

The AIO provides the following lines:

PIN #	Name	Function
1	FG	Frame Ground
2	TD	Transmitted Data
3	RD	Received Data
4	RTS	Request To Send
5	CTS	Clear To Send
7	SG	Signal Ground
8	DCD	Data Carrier Detect
20	DTR	Data Terminal Ready

Does anyone out there in NETLAND have any ideas on this subject? Send replies to me at one of the following addresses:

In response to your request: I know 6502 like the back of my hand, and I am fairly knowledgeable in direct machine language disk access, though I need to brush up a BIT on the "raw data" (prenibbilized) format.

There are some really neat protection routines out there, like SPIRALING the data (skipping half-tracks inward every quarter-revolution) and ALL SORTS of insane schemes. Personally, I don't bother to protect the arcade games that I write. I know that with a paperclip, an opened Apple II, and a neat little disk program you can break into just about anything that does not access the disk drive more than once. And for everything else- either Locksmith, Wildcard, or a Boottrace (can work every time) will copy/break it.

It depends. If you are trying to just defer the novice from copying your disk, four pokes and a DOS command, and a little program that sticks in a couple of "ninety-sixes" and does a modified COPYA will make a disk that couple of "ninety-sixes" can make your program
virtually impossible to crack using normal copy programs. I forget the location of the D5 AA 96 or whatever hex sequences make up the prolog and the epilog for a data stream but if you change those then COPYA and all those copiers that use RWTS will bomb.

I also am interested in both a gateway to the Arpanet Macintosh bulletin board and a new newsgroup for the Micro 32 machines. I have less than epsilon interest in old and clunky 6500 based micros, but quite a bit in the Mac and the Lisa.

I've been using the PCPI Appli-Card (4Mhz) for the past year and a half. The only problems I've encountered have been with the included software put out by PCPI. For instance, the hiresio driver is just to slow to be used with the driver I wrote for the Micromodem II. A carriage return delay helps, but, lines longer than 70 chars still get garbled. I'd be interested in hearing from someone who has done something similar.

The only other problem is that there is no way to customize cp/m itself. all those kludges involving a sysgen or movcpm seem to be impossible in this implimentation unless you know how to edit pcpicpm, which I don't.

P.S. i'm running an apple II+

As a brand-new Macintosh owner, I have been very favorably impressed with its ease and apparent reliability. It does what it says it does, and with very few problems learning how. But there is one thing I want to do and cannot find how to do from the MacWrite or MacPaint manuals or menus: How can I cut a picture into one side of a page? As far as I can determine, MacWrite allows pictures to be inserted only across the full width of a page. If I change the ruler to make a narrow column of text on, say, the right, the picture I put on the left moves over into the area where I want the text. Is there any way around this? To clarify, the result I want looks something like this:

```
Up to here the text is full page width, and now I
_____________________    want to cut in the picture
|                     |    beside the continuing text.
|                     |    apfskiu7t v;laiu qflwki; vas
|     picture         |    cniujls a;liug caoiu8c awpo8g@p
|                     |    campodsi ;aslgkiu canlkdsaiuc a.sjh
|_____________________|    adapvosud cliqdw8p psoutkr
                           cdovsl vpsfoi va;lsiu v.ls
;lsifvs vpaosiv as;o9v  spdokds vdslkfj lerk v/;of9v
```

No this isn't rot13!

Another question whose answer I think is "no" is: "Is there any way of making a double-size picture so that it prints out cleanly in high-resolution mode on the image-writer?"

I vote for a separate group for Mac and Lisa. They have next to nothing
in common with the Apple N series.

net.micro.lisa might be more appropriate, since both Mac and Lisa are
Lisa Technology machines. net.micro.lisa is inclusive of both the
Mac and the Lisa, but net.micro.mac doesn't appear to be inclusive
of Lisa. On the other hand... I couldn't care less.

I also vote for the ARPA gateway thereof.

Re: new newsgroup

I think that in short order the Mac traffic will push
the other traffic out of this group, volumewise, and

will reduce the need for a separate group. In the
meantime, I recommend that the headers of all messages
regarding Mac begin with "Mac:" for easy ID.

I'm looking for articles & users who have used dBASE II on an IBM PC
or APPLE IIe. Anyone with experience with dBASE II please respond on this
network. I've just found a series in A+ magazine, but will have to write
the publisher since the current copy has Part V and I missed the previous
four. Thanks in advance. This is the first time I've tried this network
so please excuse any problems with my use of the net.

I, too, believe there is good reason for separate groups for the
Lisa/Mac Apples, and the Apple N machines. However, why not use
the division that Apple itself is going to use, the Apple 32's
and the Apple 2's (I'm not certain about the second, but it is
in that vein).

It seems that the general interest in net.micro.apple has indeed
  shifted to the Mac and his best girl Lisa, to the point where
  a new group is desired. While I am not in favor of adding new
  groups for every inovation that comes along, I do realize that
  there is a major difference between the old trooper (read
  Apple][) and the new kids on the block. I don't really feel
  that net.micro.mac should be created since Mac is off of the
  same tree as the][+,e, and III, and other folk who peruse
  net.micro may start wanting new subsets for their pet machines
  too. Might I suggest that Mac could be discussed in
  net.micro.68K?

I recently plunked down my $39.95 to get the ProDos users kit. This was the only way the local computer stores offered ProDos to people not wishing to buy a computer system or disk drive. I also had to spend $70 for 5 ROMs to upgrade my Apple-II to a II+ since ProDos uses the language card for itself and the Users Kit is written entirely in Applesoft.

I was more than a little surprised to find out that the Users Kit does not even tell you how to type in any ProDos commands. All it is is a menu-driven program which lets you do ProDos commands without having to know the syntax.

Well this is just great since I wanted to port some of my Applesoft programs over to ProDos. Apparently there is a "Applesoft Programmer" guide to ProDos, but it is not available yet.

Has anyone else had any better experience with ProDos?

The only "officially" supported card with ProDos is the Thunderclock.
Now I think highly of the Thunderclock, but I happen to have a CPS
Multi-Function card. Has anyone yet tried to support other clocks
besides the Thunderclock with ProDos. Any hints on how to do it?

  Well, Apple has recently put out Pro-DOS which seems to have a number
of nice(r) feature, as compared to DOS 3.3 (not that hard to beat).
Among these is a new hierarchical file system.
  My problem is that it seems Pro-DOS will not run (so I've heard) on
floppy disk cards that are not apple originals. Lo, I've tried a
friend's copy on my non-std machine, and it hangs.
  Does anybody know whether this (mis-?) feature was intended, and
how/why it works like that? More importantly, any suggestions
on how to get it to go? My case is an especially irregular one
since I happen to run a home-made apple II+ compatible. Among
other things, this setup does not afford me the possibility
of getting a new "real" controller card.

I am very much in favor of creating an apple mac/lisa newsgroup -
but *not* in calling it net.micro.mac. According to all of APPLE
Corps literature, the mac is a (small) part of their thrust into
32 bit micros, using "lisa technology". Therefore I propose that
the group be called net.micro.lisa after the family of computers
APPLE proposes, not merely a single member of the family. If a
precedent is set for naming newsgroups in net.micro after specific
machines (imagine net.micro.pc and net.micro.xt) instead of after
generic categories, then the groups will proliferate uncontrollably.

Net.micro.mac is an excellent idea. In response to some other
comments:

  Net.micro.apple.mac is an unmanageable name.

  Probably the group should be called 'mac' rather than lisa,
  since there are many more Macintoshi than Lisas.

  Net.micro.68k is devoted to small multi-user systems very
  unlike the Macintosh. Macintosh discussion in net.micro.68k

seems an intrusion.

Why does the fact that there is a lot of traffic in INFO-MAC argue AGAINST
the desirability of a gateway to USENET. Wouldn't USENET types (like me)
want to see all this (presumably interesting) discussion?

Sending MAIL directly is has been giving me problems, so I am posting this letter on the net. It may be of interest to other Apple owners.

I use the Net only on weekends, and I didn't bring the specs on protecting a disk... I'll bring them next week and post the info on how to put a decent protection on an Apple DOS 3.3 disk that will give a lot of copiers a bit of trouble.

In response to your other question: You have an unbroken disk which you would like to put in a normal 3.3 format; the program only accesses the disk once.

Here is basically how to do it: Here is what you need:

   64K Apple II Plus or Apple IIe (Apple II Plus must have the 16K card)
   One disk drive.
   Somebody who has an old Integer-BASIC Apple II from before about 1980
      that has an old "Monitor Rom" - the old version of the Apple's ROM.
      You know an Apple II has a monitor ROM if it says "APPLE][" on the
      top with no green "PLUS" below it AND if you go into BASIC and try
      pressing ESC I - if it moves the cursor up, it is not the right kind
      of ROM.
   Any old tape recorder, a blank tape, and the proper cables to connect
   the recorder to the back of the Apple II as specified in the manuals.

Well, the old Apple IIs with the Monitor Rom are pretty scarce (I've got a friend with a 1978 Apple who lent me the ROMs) But, if you can find one, here is what to do:

0. Boot up your protected disk and Press reset. If it goes into BASIC, then
   CALL- 151 and skip to step 7. Otherwise...

1. Go to the Apple II with the Monitor Rom (Let's call it the Old Apple)
   and boot a normal 3.3 disk. Then do the following command:

   BSAVE MONITOR ROM,A$F800,L$800   (from $F800 to $FFFF)

   onto one of your disks. That is IT for the Old Apple.

2. Boot up the SYSTEM MASTER 3.3 on your New Apple. Make sure it loads
   INTEGER BASIC into the machine as it should on a 64K machine.

3. With the SYSTEM MASTER in the drive, do the following commands:

   FP
   BLOAD FPBASIC,A$6000
   LOAD HELLO
   BLOAD MONITOR ROM,A$8800   (insert your disk)
   BSAVE INTBASIC,A$6000,L$3000   (on your disk)

```
   RUN                                          (should load in the file
                                                 INTBASIC into the upper 16K)
   CALL -151
   $C083                                        (turns on RAM card)
   $C083                                        (gotta do it twice)
   Now try RESET and - presto - you are still in the Monitor! (I hope)
```

4. Hook up the tape recorder, plug in all the cables: Cassette IN,OUT

5. Boot your commercial disk that you want to break and pray that it does not use the upper 16K or demolish it.

6. Wait until it loads everything in and just then press RESET and go into the Monitor - if it hangs, the author has pulled a fast one with the 16K. If it reboots, just keep hitting RESET until it goes into basic, then CALL -151 to go into the monitor.

7. Hope that the program starts at $800 and you haven't eliminated part of it by typing something in (messes up the keyboard buffer, $200-$2FF) or the text screen ($400-$7FF or so) and do the following command:

   800.BFFFW (it should work like it does in the Apple II reference manual)
   Which assumes you have pressed RECORD-PLAY on the tape recorder and have all the cables hooked up.

   Now the cassette can give you a LOT of trouble - I junked mine when I got a disk drive in '81. You've gotta have a good tape recorder, a great tape, and a lot of luck for it to work, but if it gives you a beep and sits there for ten minutes or whatever, then gives another beep and a *, then...

8. Boot up a normal 3.3 disk and CALL -151, press play on recorder, and

   800.BFFFR

   If it says ERR, then try changing the volume, checking the cables; if that doesn't work, give it some time, sleep on it, forget it ever happened, and buy a FLASHCARD or WILDCARD for $100, or, try boot-tracing the disk, which is pretty nasty.

9. Assuming it works, BSAVE PROGRAM,A$800,L$7FFF
                      BSAVE PROGRAM2,A$8000,L$1600

10. Somewhere in that mess, which is probably mostly empty, is your program, which you can search out and BSAVE in one file.

Good luck...

   800.BFFFR

There has been all of this discussion about whether a new
apple newsgroup should be net.apple.lisa or net.apple.mac.

Why not call it net.apple.32 which is how Apple Computer talks
about its new product line.

I've seen a lot of people proposing or supporting
the idea of a newsgroup for the Macintosh. On the other
hand, I haven't seen anyone submitting articles
about the machine. Seems to me everyone wants to
read about it, but we don't have anyone willing to
say anything about the machine. Until more people
have something to say about the Mac besides "start
a newsgroup", I don't think a new newsgroup is necessary.
If such a newgroup is necessary to link to the ARPANET
articles, then I could support it.

     I have a robust Apple II system for sale -- perfect for
running Pascal at home (UCSD of course). It's got enough disks
to be usefull and enough ram disk to be fast. It's got a serial
and parallel port to connect to your mainframe (I talk to an
11/70 running Version 7)

HARDWARE		ORIGINAL COST
1	Apple II with 64k memory	$1400
1	Apple 5.25 inch disk drive with Apple controller	550
2	Lobo 5.25 inch disk drives with controller	900
1	Apple language card	400
1	Suprterm 80 column card	300

1   Prometheus Versacard
         clock,serial,parallel,bsr   220
1   Synetix ram disk 544K   550
1   MPI printer   710

                                 $5300

SOFTWARE
     Apple DOS 3.3
     UCSD Pascal IV
     Apple Pascal
     Flight Simulator
     6502 Assemblers
     Games

     All documentation included

I will accept the best offer over $1000. (FOB New York) Call for more info

It seems that a lot of the Mac discussion is/was related to
the initial startup excitement of the new product. Lately, the
Mac debate seems to be centered mainly over whether there should
be a separate newsgroup. Why don't we wait and see if there will
really be a continuing discussion of the Mac, beyond the "new product"
speculation. There really hasn't
been that much discussion in .net.micro.apple anyhow.

It looks to me like your disk "backup" method will only work
on the simper protection schemes.
   For those of you who missed the lead-in article, it outlined
saving a memory image of a "locked" program by using the built-in
tape read/write code. The method for getting control of the Apple
was to re-route the RESET vector via the language card so that
you could use the monitor to capture the program.
At least, this was my understanding.
   The problem seems to be that:
   a) most well protected software uses a multi-stage boot (I
      would still call this "single disk access" loading), and
      the first stage often disables the language card.
   b) Some protected software keeps code "behind" the keyboard
      buffer so that typing things destroys it.
      (i.e. when you trys to type in the tape save command.)

   One method the "crackers" use to deal with software that
does these "neat" things is called "boot trace cracking". This
involves copying the bootstrap ROM code (at c600) and making it
branch back to the monitor after the first phase of boot, instead
of to the loaded code (at 0x0800). This procedure is then
repeated for each phase of the boot.
   To make this difficult for them, intermediate sections of the
code can be loaded at the monitors keyboard in buffer, or into
the screen buffer so then then control returns to the monitor, it
automatically erases the offending code.

Does anyone out there have any info on software which allows the use of the extended memory on the Apple //e as a ramdisk in Apple Pascal? I have seen several ads for products along this line, but I've been told that some of them are not fully compatible, ie. they don't have a p-system volume designation. Any info on these programs? Better yet, does anyone know of a public domain ramdisk program for Apple Pascal? Any help is appreciated.

On four occasions in the 10 days we have had our Mac, it has crashed
with checkerboard/ladder patterns on the screen and grunchy noises
from inside. The aftermath has been different each time: (1) lost
all folders off the Guided Tour of Write/Paint (and the tour wouldn't
run that way), (2) rebooted itself, no subsequent problem, (3) stopped
dead, no subsequent problem, (4) lost all folders from the main Write/Paint
disc.

I rebuilt the Write/Paint disc, knowing what files should be in what folders,
but couldn't rebuild the Guided Tour. Today I went to check it out, before
taking it to the dealer, but the disc was fine again. Apparently under
some conditions discs will rebuild themselves (? If they are used as the
boot disc ?). The dealer said that he had observed the same problem a
couple of times and had correlated it with his furnace going on, and
that therefore it was a problem of spikes or momentary drops of line-voltage.
According to at least one of the articles I read on the Mac, its power
supply should be immune to this sort of thing.

Does anyone know the truth of this matter? Should I get a line filter
or surge protector? Are the first delivered Mac's the same as what is
written about? Could the problem be something entirely different?

Actually, I contacted the administrator for INFO-MAC, and there
is already so much traffic just on the ARPANET mailing list that
he feels a USENET gateway would be inappropriate at this time.
He is also attempting to have the mailing list concentrate on
the schools in the consortium that got the special pricing deal.
Though if INFO-MAC goes to a digest format, it might then be
appropriate to gateway that one-way into fa.info-mac (you'd
mail submissions to one address rather than posting directly).

So. No INFO-MAC gateway for the moment. That leaves a USENET-only
newsgroup. There are several options, including:
     a) leave things alone and use net.micro.apple
     b) create net.micro.apple.mac for MAC and LISA traffic
     c) use net.micro.68K
     d) create a newsgroup of some other name (several suggestions).

Is there such a thing as a ex style editor for the Apple? Strange as it may seem I need a editor that doesn't require cursor movement. I am blind and use a braille terminal which I attach to a serial port on the Apple. Thank you.

I live by myself, am home little and use the telephone at home only for a few calls, so I decided to try Local Measured Service when it was offered here in C&P land. I opted for the service in which one pays a charge for the dial tone and all calls are charged at .035 for the first minute and at .015 for subsequent minutes. I was assured that calls prefixed by 1 or 0 (long distance) or to certain exchanges (TPC for example) would not be charged as local calls. I was also assured that not just a count of the calls would be made, i.e. answer supervision would be available to the local equipment.

I received my first bill last week and was rather surprised. By my records which were kept quite carefully, I made 24 calls during the billing period. I did not time each call, just made a record of each call made. I was billed for 36 calls!. I was also billed for 26 additional minutes which is reasonable. I have talked to TPC billing about this and got nowhere. My exchange (301-728) was installed in the early 60's as a replacement for the old MADison exchange which was the last cordboard exchange in Baltimore City. From this date and the fact that I know it is not an ESS exchange, I assume it is a #5 Crossbar. Does anyone have any idea what kind of equipment is available for installation in this kind of exchange to provide LMS? >From the numbers above, it seems likely that I am being charged for all calls to all points and whether they are answered or not, but I can't prove it now. I am keeping much more careful records this month.

Since we are allowed to try LMS for four months at no charge for change in service class or for a change to another class during that time, I though it would be an interesting experiment. If anyone has any ideas on this matter I would be interested in hearing them.

n084 1827 11 Mar 84 BC-PHONE Woman Gets a $109,505.86 Phone Bill By ROBERT D. McFADDEN c. 1984 N.Y. Times News Service

NEW YORK - For weeks, Jane Landenberger had been receiving unusual telephone calls in her Bedford, N.Y., home. Then, last Monday, she got the oddest call of all - she was talking on the phone with a friend when an operator broke in to say that the telephone company was trying to reach her, and that it was urgent.

''It was a supervisor - a Mrs. Gackstatter in the business office in White Plains,'' Mrs. Landenberger recalled Sunday. ''She wanted to talk to me about my February phone bill. She said, 'It is excessive.' ''

''I was a little flip,'' Mrs. Landenberger said. ''I said: 'It was excessive last month, too. How excessive is it?'

''She said, 'It is $109,505.86.' ''

As if that wasn't enough, Mrs. Landenberger said, she was told that ''the bill was too large - too heavy - to send through the mail, so they were going to send it by United Parcel Service.''

''I thought, Oh, my God. This is something else!''

The next day, a UPS truck delivered the bill - all 2,578 pages of it, wrapped in five elastic-bound bundles that were nearly too heavy to lift. The bill recorded about 15,000 calls to and from Europe, South America, Africa, the Far East and points across the United States.

All had been charged to Mrs. Landenberger's telephone credit card - the one she cuts up each year so it will not be lost or stolen - in what New York Telephone Co. security officials Sunday called one of the biggest frauds of its kind ever.

It was done, apparently, by a host of people - no one knows yet how many - all of whom had to have known both Mrs. Landenberger's home telephone number and her telephone credit card number. How the call thieves got the numbers is unclear.

An investigation is under way to catch the culprits, who may have been involved in anything from college pranks to multi-million-dollar drug deals. But the malefactors' bogus credit has at least been cut off.

Telephone company officials have issued a new credit card to the dazed Mrs. Landenberger.

And to ease the shock of her bill somewhat, they have issued her a credit for $109,457.83, leaving a balance to be paid of $47.03, the total for her legitimate calls last month.

Still, the experience has left her a little unnerved.

''I have a feeling my phone number is up in every rest room from here to California,'' she said Sunday, as she leafed through the stacks and stacks of charges.

''Here's a four-hour call from Miami to Caracas for $200,'' she said. ''There are lots of calls to South America. There are calls to Libya, Nigeria, England, Italy, France, Alaska, the Philippines. They're from the United States mostly, the great majority of them from the Miami area.''

The strange tale of Jane Landenberger's telephone bill began last January, she said, when more than $300 in excess charges appeared.

''I called the company,'' she said. ''They were very nice about it. They called me back and said they had credited the $300 to my account.''

Then, early in February, the weird telephone calls began coming in at all hours of the day and night, leaving Mrs. Landenberger sleepless and puzzled. Some of the calls, she said, were placed by ''a man with a foreign-sounding voice.''

''He would ask for Magdeline or Sandra or Teresa or he would say 'Who is this?' '' she said Sunday. ''One night there were 19 calls. I got no sleep at all. I believe they were long-distance calls because the connection was kind of crinkly.

''I also began getting calls from telephone operators asking authority for third-party calls from Miami to Haiti, or Cincinnati to Mexico or Quebec to the United Kingdom. Of course I always refused permission, but that apparently didn't stop them.''

To stop the mysterious calls, Mrs. Landenberger eventually used a ruse suggested by telephone company security officials. The last time the stranger called, she flashed the operator and said - so that the caller could hear - ''Please trace this call.''

''That ended my receiving any more crazy calls, but apparently they were still charging calls to my account through February,'' she said.

A telephone company spokesman, Lon Braithwaite, said that a new credit card number was issued to Mrs. Landenberger on Feb. 21, but Mrs. Landenberger noted that many of the calls listed on her huge bill were dated after that.

When the phone company finally notified her of the size of her bill, Mrs. Landenberger said she got ''a tiny bit frightened.''

''I know I'm an honest person, and my friends all know that I'm an honest person, but what does the telephone company know about me,'' she said. ''As far as they are concerned, I'm not above susupicion. I could be running a numbers operation or something.''

The phone company evidently had no doubts about Mrs. Landenberger. But until further investigation, the spokesman said, it was unclear whether her case represented an aberration or a serious flaw in the security of telephone credit cards.

Unlike credit cards used in stores, telephone credit cards need never be shown to anyone.

A credit-card caller on a Touch-Tone phone simply punches in a personal identification number that is printed on the card. On rotary phones, the caller tells the number and some other information to the operator.

Mrs. Landenberger said she got her telephone credit card a decade ago so that she could call and receive calls from her children while they were away at college.

Now, she said, she sometimes uses it to call or take calls from her children, who are in France, the Philippines, New York City and Providence, R.I.

I guess that I should have clarified that the AT&T concern was with power line shorts on the telephone pole itself, not with plugging the phone cord into the wall outlet. I'm still wondering if this is a serious problem.

Subject: Bell's National Security Group In Operation
Location: <AUGMENT,107234,>

>From MICROWAVE SYSTEM NEW (Feb. 1984)

The Central Services Organization of the seven Bell Regional Holding Companies said that its National Security and Emergency Preparedness (NS/EP) Group, located in Washington D.C., is now operating to meet the nationwide telecommunications planning and response needs of the Bell companies.

In order to meet NS/EP requirements after the split-up of the Bell System the federal court agreement requires that the company establish and maintain a centralized communications group as a single point of contact for all national security and emergency preparedness matters, Marvin Konow, director of the group said.

The group will advise and provide coordination to the Bell Operating Companies (BOCs) in the development of national security and emergency preparedness technical standards and nationwide telecommunications planning. An emergency alerting and respone center has been formed to alert the BOCs in the event of an emergency or crisis, the spokesperson said. The group will also participate in national industry-wide groups sponsored by the government to coordinate emergency and crisis communications activities and nationwide network planning.

n013 0747 13 Mar 84 PM-PHONE By ROBERT D. McFADDEN c.1984 N.Y. Times News Service
    NEW YORK - While the culprits who ran up $109,504.86 in global calls on a Westchester (N.Y.) County woman's telephone credit card

remained unidentified Monday, three more instances of similar fraud totaling more than $114,000 came to light.

The New York Telephone Co. said Dr. John Weinstock of Golden's Bridge got a 505-page bill for more than 4,000 fraudulent long-distance calls in February totaling $61,180.55. It also said a subscriber in Chappaqua, who asked not to be identified, got a bill for $18,399.77 in fraudulent February credit-card calls.

In yet another case, Barbara Zerzan, a resident of Manhattan, was reported to have received a 710-page bill for more than $35,000 in bogus credit-card calls during February. The telephone company said last night that it could not immediately confirm the report.

Meanwhile, investigators for the telephone company pored over the 2,578-page, 15,000-call February bill of Jane Landenberger, of Bedford, whose case was reported over the weekend.

The fact that three of the four cases involved Westchester County subscribers suggested that someone in the telephone company's White Plains office, which is the headquarters for the area, might have been the conduit for the subscribers, numbers. This possibility was under investigation, company officials said.

A company spokesman, Tony Pappas, said that telephone credit-card fraud was an increasingly serious problem.

''The problem of fraudulent calls has become a major concern of the company to a point where we have asked all employees to cooperate in protecting credit-card numbers and to let us know of abuses they might be aware of,'' said Pappas, the company's director of press relations.

With more than six million subscribers and one million credit cards in circulation in the state, the telephone company now confronts more than $14 million a year in fraudulent credit-card calls, Pappas said.

In the last two months, 29 people have been arrested on charges of misusing credit-card numbers. The charges are misdemeanors, meaning that they are punishable by fines and no more than one year in jail, Mr. Pappas said.

Unlike credit cards used in stores, telephone credit cards need never be shown. A caller using Touch Tone phones punches in a personal identification number printed on the card, and callers using rotary-dial phones give the number and usually some other information to an operator.

In each of the cases currently under investigation, Pappas said, the calls were evidently made by many people who had somehow obtained a subscriber's home telephone number and telephone credit-card number. The calls were made to and from numerous points in the United States, Europe, South America, Africa and the Far East.

The pattern of calls - often hundreds a day from widely separated points - suggested that the subscribers' numbers were circulated to many people quickly, before the volume and pattern of calls could become known to the authorities.

In each case, the credit cards were canceled by the subscribers, but, as the subsequent bills noted, the calls continued to be put through on those cards for some time afterward.

The frauds will not cost the subscribers anything. Mrs. Landenberger will be assessed only $47.03, her actual charges, and the

other subscribers will be accorded similar consideration.
    Dr. Weinstock, a physician, and his wife, Connie, a psychotherapist, were taken aback by their bill, which listed calls to Ecuador, Peru, China, Japan, Sweden and other places.
    The Weinstocks and Mrs. Landenberger did not know each another, but spoke by telephone over the weekend.
    ''I spoke to her Sunday night after we heard about her having the same problem,'' Mrs. Weinstock said. ''We were at a party, telling our fantastic story, and somebody said, '$61,000? That's nothing. There is a story about this woman who had $109,000.' ''

From: Ralph W. Hyre Jr. <RALPHW@MIT-XX.ARPA>
Subject: AC Power vs. step by step

Last night some real winners connected the AC power line across one of our Dormline instruments. (Dormline is the local MIT phone system connecting the dormitories. It is a step by step system).

This had the unfortunate effect of blowing out the first line finder for 100 phone numbers (the 6300 series), so many people had no dialtone. (Incoming calls could still be received.) Several instruments were damaged or destroyed by the excessive voltage, and started smoking.

Is this a 'normal' occurence with step-by-step (could it happen anywhere? - the MIT dormline system is ~30 years old)? Also, is there any way to protect against this happening in the future?

- Ralph Hyre

Over the past two weeks I count the following articles submitted to net.micro.apple:

Articles about II+ and //e	12	(0.86 per day)
Articles about Lisa/Mac	0	(0.00 per day)
Articles about new newsgroup	21	(1.50 per day)

I suppose if we form a new newsgroup, then at least the net.micro.apple readers won't have to "n" past all those articles about new newsgroups.

     Does anyone out there have any info on software which allows the
use of the extended memory on the Apple //e as a ramdisk in Apple
Pascal? I have seen several ads for products along this line, but
I've been told that some of them are not fully compatible, ie. they
don't have a p-system volume designation. Any info on these programs?
Better yet, does anyone know of a public domain ramdisk program for
Apple Pascal? Any help is appreciated.

Does anyone in netland have any programmer's information describing
the QuickDraw graphics routines for the Mac ?

The Microsoft BASIC manual references a "QuickDraw Programmer's Guide",
does such a beast exist yet?

And while I'm at it, any information on 'C' compiler(s). With a
good K&R 'C' and the Mac toolbox, the possibilities are endless.

I hope we can get some good discussion on program development
for the Mac as more become available.

I promised to post my simple version of dc (from the C book)
and I finally got it here. When I did the first batch of tools
I couldn't get it to compile. I later found that the floating
point library must be included. The only indication of this
was a run-time error in the dc program when I tried to print
the number. I was surprised that no undefined symbols were
discovered during the link. Any ideas?

I would like to know whether anyone has used the Super-MX Epson interface card from Spies Laboratories. This card claims to have all of the standard features found on cards like the Grappler, and, in addition, to print nearly daisywheel quality characters using two passes in graphics mode. The results reproduced in their advertisements seem to support this claim, but I've noticed that the standard Epson print they include also looks better than usual, maybe due to the higher contrast of the reproduction. Anyway, I'd like to see a full page of real text, or hear from someone who has, before I spend the $200 or so that the card costs. The card also can add several fonts, including what appear in the ads to be very nice Roman, Letter Gothic, Orator, Script, and Old English; it can print 12 cpi in at least the Roman font. It sounds great-has anyone out there got/seen one? I'll summarize any responses.

I don't have my maps here at work, but I will try and

find where the sword was and let you know. I am now working on
the third scenario, and it is great. I finished Knight in about
2 weeks, but am taking much longer on Legacy. For one thing, you
need to have both a good and an evil team. This tends to slow development
for any one team (although I do have a mage that is neutral that travels
with both). Has anyone finished this one yet? Never can tell when
I may need some hints.

BTW, I did not get the original article this was a response
to? Where did it come from, and any ideas why it didn't get here?

I have recntly purchased CUBIT, a QBERT imitation & find that while it will
boot on a genuine APPLE drive, it will not boot on a Shugart-based lookalike
by TRAK which I just purchased. It's a full size drive.
The speed is very close, and an alignment test using a disk written on an
APPLE drive shows my look-alike alignment to be virtually identical.
Can anyone give me any help on how to overcome the problem?

{Oh great and mighty gods of NEWS!! Do NOT eat this message!!}

I realize most of you out there are really sick and tired of hearing about
termcap requests that have been repeated over and over again, but here I
go!!

Does anybody have a termcap for an Apple][+ with a Videx Videoterm
80-column card?

please reply by MAIL.

Thanks in advance,
     Eric C. Brown.

Has anyone out there used Apple Pascal on an Apple system with a RAMDISK?
(I think RAMDISK is the correct term, I'm referring to the external
peripheral device which is actually a bunch of RAM but appears to the
Apple as two disk drives.)

Is there a marked improvement in such things as compile times in Pascal

when using the RAMDISK instead of a real disk, and does anyone have a rough estimate of the improvement.

A friend of mine told me that when using the RAMDISK with DOS files, it did not perform as well with text files as with binary files. Does anyone know if this is true and why? Does this have any effect on its use with Pascal.

Any info would be appreciated.

Thanks,

Rich

If you have a piece of software which will boot on an Apple drive but not on an Apple look-alike drive, you are unfortunately out of luck. The Apple drives are capable of performing various feats which they weren't designed to do: stepping every quarter track, writing to more than 35 tracks, and having reproduceable times between tracks. These features have been used by many of the copy protection schemes because they are "unreadable" by standard copy programs. A protection scheme might include some essential data in track 36, some data written on track 12.25, and have tracks 15 and 16 synchronized, for example. Many of the Apple look-alikes aren't capable of reproducing these tricks: slightly different electronics, or hardware that was designed slightly differently. Those drives just can't run software which uses some of the crazy protection schemes.

The following two products for the Apple have been of considerable utility to me:

1) Micromotion FORTH

This software product is a complete and unified programming environment. It includes its own disk operating system (crude, but easily extensible, as are most well-designed things in FORTH), full-screen editor (full-screen, crude), and FORTH compiler. Everything is memory-resident, and you can get by easily with one disk drive. I believe the system costs around $100 and for another $50 or so you can get floating point support and high-resolution graphics utilities, both of which are very complete and fast.

FORTH is not, as it stands, a dream language. But the debug cycle is so fast in this system that you end up accomplishing things at a far greater rate than you would in most others. An added advantage is that you have absolute knowledge of the guts of the system. This, for example, enabled me to implemented multi-tasking capability with relative ease.

2) The Mill 6809 coprocessor (made by Stellation Two)

This board has a 1 MHz 6809E processor which shares the Apple bus. When the 6809 is running it uses the DMA line to put the 6502 on hold, for about 80% of the memory cycles. The 6502 runs in the 6809's "dead" cycles. So, to some extent, there is true shared-memory multiprocessing. The 6809 can be started and stopped, and either processor can interrupt the other, under software control. You can get 3

different software packages: a PASCAL accelerator, a 6809 macro assembler (which I have, and highly recommend), and the OS/9 operating system.

I used the Mill, and an EPROM programmer card, to write monitor and BIOS ROMS for a homebrew 6809 system -- it was extremely convenient. Another interesting use would be as a dual-processor FORTH machine; using a table mechanism, one copy of each FORTH word would suffice.

If anyone does or has done something interesting with these or other Apple goodies, please mail me.

uwvax!anderson (David Anderson)

I realize this question has probably been asked before, but I'm new to the net.

Could those knowledgeable please mail me information on communications software/hardware they have successfully used to access UNIX on an Apple (hopefully as an intelligent terminal) ?

I have the following equipment:

Apple II e (64K)
2 drives
80 column card
Microsoft Softcard
1 Trimline telephone (brown)

Thanks in advance for any help.

subject:cheap Z-80 cards

    There is a place in Illinois named XICOM. They sell
Taiwan Boards for many of the popular interface cards, apple
motherboards....(write me if you don't know what I'm talking
about when I say " Taiwan ".) For reasonable prices, bareboard

or assembled/tested. I seem to remember their prices were ~18
bucks for a bareboard(mine cost ~40 to build) and ~60 for an
assembled/tested one. They are quite a nice company to deal
with. I don't have the address handy, but they advertise in
Computer Shopper.

A New Apple, Claiming to be IBM Compatible?

A word from my friendly local Apple dealer:

"The MACINTOSH has been the works for at least two years and there is still
some debate on its ultimate configuration. Apple is expected to introduce
its new contender early in 1984 and will pose a challenge to IBM's Peanut.

Unlike the Peanut, a standard MacIntosh will include a monitor,
professional keyboard, and a disk drive. It is expected to sell for about
$2000, only 25% more than a fully loaded Peanut. The MacIntosh is a
derivative of the Lisa. The MacIntosh is based on a 68000....it uses a
newer, perhaps more sophisticated operating system than IBM's PC-DOS
[???!!???!?].

Apple, however, is hedging its bets and plans to broaden the base of the
software that will run on the MacIntosh. John Scully, Chief exec officer

of Apple, has reportedly ordered the MacIntosh to be compatible with the PC. Just how Apple plans to achieve this compatibility remains to be seen [you ain't whistlin' Dixie there]. The MacIntosh is unlikely to have internal expansion slots, but Apple may be able to perform a little magic on the 68000 to allow it to use programs written for the other microprocessors.

Several features may indeed make the MacIntosh more marketable. First, the MacIntosh is designed primarily for business applications; its larger memory capacity and high resolution monitor support that claim. Secondly, it will be promoted for use in education. (A university out East contracted for 3000, sight unseen [anyone know who?].) And third, several independent software developers have had the MacIntosh for the past 18 months, and when it is finally unveiled, buyers should find ample software support."

For what its worth.

I have used the RAMDISK under Apple Pascal 1.1. It's great if you're in for a long session. I was working on a large project with 9 different source files, and I put them (and the compiler) on the RAM. It made a huge difference - a 10-minute compile became about four minutes. Also, flipping in and out of the editor (i *wish* you didn't have to quit the editor to get a new file!) becomes much more comfortable.

It takes a while to get it loaded, though, and you do have to remember to save your "files" on a real diskette every so often. Unless you're spending a lot of continuous time on the machine, it's not worth it.

The program which loads files from your diskettes to the RAM is a

little strange. Its mechanism for selecting files leaves a lot to be
desired. It also plays a little tune which gets annoying after a while.

Since I like my job, I can't comment on the speculations regarding
MacIntosh's features or prices. I thought I'd clarify how Apple is
making its machines IBM PC compatible.

To achieve compatiblility the Apple needs:

- Disk drives that work
- A new microprocessor
- A different memory configuration

All this is provided on something like the CP/M cards out there by
telling the 6502 to go to sleep and substituting a new processor. The
hardware still knows enough to call on the 6502 for I/O.

Emulating a PC is a little tougher, though, because one wants PC disks
to run on the system. Well, the PC uses the index holes on diskettes
(it's hard sectored). Apple diskettes are completely soft-sectored,
so Apple doesn't bother to install the extra hardware necessary for
hard-sectoring. This makes reading PC disks a bit tough.

The solution is to plug in a box that has the appropriate disk drives
in it. Apple has announced that Rana will be building these boxes.
The drives will be able to read either Apple or PC disks. The box
will also contain the new processor, etc.

Now, that's how it will work in the Apple II and III. I leave it as
an excercise for the student to guess how it will work for Macintosh.

Does anyone have a diagram of the wiring needed to change the Apple
Communications card (A2B0003X, the old 110/300 baud one) from the
standard speeds to 9600/? baud. Wiring for changing to 1200/300 and
4800/1200 are given in the manual, but no word of 9600. We had one,
but it disappeared in a robbery one night, and we'd like to have another.

Thanks in advance,

I am trying to find a program for the apple that uses the Modem7
protocol for file transfer. If anyone can provide the source or
pointers to the source I would be most grateful. Please mail
replies as I do not usually read this group. Thanks in advance.

I am intersested in controlling appliances such as lights,
tape recorders, et. from my home computer. I have the BSR remote
control system, including controller,clock,ultrasonic remote,lamp dimmers,

and appliance modules.

The computers which I would use for control are my appleII+, and/or my Sinclair ZX81(Timex 1000).

If you know of companies which offer BSR-compatible interfaces, or of articles which describe their construction, please let me know about them.

thanks....

There have been several notes about the above. You need an
Apple running CP/M (not necessarily but this is a good way) with
disk drive and 80 cols. You need a serial card (I recommend the
CCS 7710D) and a modem.

Next you need software. ZTERM Professional is very good with a nice
macro capability for about $120. However, MODEM7 has everything
but the macros AND you get source code, plus batch transfers of
files to another MODEM7. The latest version around that I have seen
is MDM712.COM. There is an associated library called MDM712.LBR which
contains the object code, documentation and a bunch of overlays for LOTS
of different computers. This is a public domain program that is widely
available on bulletin boards.

There a couple of versions of UNIX programs that implement the XMODEM
or Christensen protocols that modem7 uses. I have seen umodem and tmodem.

I am probably soon going to purchase a new Epson RX-80 printer for

use with my Apple II Plus. I am not sure whether the deal for $300
includes a printer interface to plug into the Apple's slot, but it
probably doesn't.

Does anyone have an interface for sale? If so, I am interested.

Another question: Other than printing speed, what really are the
differences between the FX-80 and the RX-80? And what has been
changed in the MX-80 to make it into the RX-80?

Thanks,

To speed up a Communications card to 9600 baud:
1. Make the modification in the manual for 4800 buad.
{15 of A2. Chip A1 still isn't required.
3. Cut the trace from A1 pin 2 to pin 38 of the edge connector and wire it
to pin 37 instead (this won't work on the new cards with gold edge connectors
as they don't have a contact for pin 37).

Anyone out there doing any electronic or computer music?

I have a Rhodes Chroma hooked up to an Apple II+. I use it mostly for myself (I have a (very) small home studio). Any Chroma owners out there?

Any composers (pop/jazz/classic/vanguard) ?

,Karl Malik

I am considering buying an el-cheapo baseband monitor from Walker Electronics
in Hacienda, Texas. It is stated to be a Ball Brothers equivalent with 12P4
phosphor . It goes for $35.   Before I take a shot in the dark in total ignorance
has anyone dealt with Hacienda, or can you comment on the usability of the
monitor?

Heathkit sells a serial to BSR interface which can control
up to 256 BSR modules. Inside, I believe, there is a 8045
microcomputer that makes it very easy to control from
a computer.

I have recently become aware of an business opportunity for:

authors of CAI-type educational packages
or companies who distribute, market, or publish such packages

They are basically looking for packages to teach:

How to use:
- Spreadsheet packages: 1-2-3, VisiCalc, Multiplan
- Word processors: Wordstar, Perfect Writer, etc.
- Data base managers: dBase II
- Not to exclude other packages

Standard educational courses: (all grade levels)
- Math skills
- Reading skills
- Science
- Adult Personal Development

Business Courses:
- Basic skills such as bookkeeping, typing, secretarial
- Skills to advance one's career
- Accounting, investment, and real estate courses

Other Courses:
- Any other good courses

Courses should be CAI-type courses to run any of these machines:

IBM PC & clones
Apple II family
Commodore 64

This company is interested in marketing these courses in a rather unique way and is interested in working out a cooperative arrangement to distribute this educational software.

If you have written such a package yourself or know of somebody who has and would like to market it, please reply directly to me via email and we can make further arrangements at that time.

Thank you,

John Crane
Fortune Systems, Inc.
Redwood City, CA

I am in the process of building up an apple system. I have populated a
partially destroyed mother board and copied a new operating system. The
system is now working with the exception of the joystick port. I am using
a replacement power supply. The system is almost finished but I have a couple
of areas where I need some information to help me finish the job.

I would like to hear from anybody who is familiar with the D.O.S.
I am trying to build a disk drive interface card and have many questions.
Where does the D.O.S reside?
What are the control and data lines that connect the card to the drive?
What requirements are placed on the type of drive and disks that can be used?

Can anyone point me in the right direction for a simple, yet functional
terminal emulation program for the Apple ][?

I have an Apple ][+ with a Micromodem II and a Micromax 80 column card.
I have used Transend (some number) and was not thrilled with the levels
of menu.  It's like a D and D game trying to remember how to get back
where you started.

What I would like is a program that emulates some terminal (VT100?),
can capture a buffer (about 16K characters, perhaps) of data, and
can later dump that buffer either to disk or a printer.

Does such a thing exist?  Can I buy or beg it?

Thanx in advance,

Ted Estes

We need a second drive for our Apple //e and would like some opinions on the various Apple compatible disk drives. I have always been satisfied with the performance of Apple's drives, but am considering other drives because of size, storage capacity or price advantages. We would be interested in your comments or suggestions about the various brands. In particular we would like to hear about drive reliability and read/write error rates. We would also like to know whether the disk can use the standard Apple disk controller card and standard DOS 3.3. If a modified DOS is necessary, how difficult is it to install the patches? (The modified DOS question may apply to some of the high capacity disks now available.) Specific brands we have heard about include Rana, Micro-Sci, Concorde, and the new Amdek micro drives. Are there other brands which we should consider? Responses can be mailed to me or posted to the net. (Perhaps this can start some discussions about Apple compatible hardware experiences and advice.) Thanks!

The new SOFTERM-1 and SOFTERM-2 terminal emulater packages are now being shipped by SOFTRONICS. These are upgraded versions of the SOFTERM package first offered by SOFTRONICS in August 1982 and of which I was a devoted supporter. Since there are still people out there using Apples out there on UNIX without a good terminal emulator, I thought would like would share some information about this package. SOFTERM-1 and SOFTERM-2 are similar packages with one major exception, SOFTERM-2 provides terminal EMULATION while SOFTERM-1 is a smart telecommunications package but lacking the emulation capabilities of SOFTERM-2. SOFTERM-1 sells for $135, SOFTERM-2 for $195. Any comments below, with the exception of terminal emulation apply to both packages.

This package allows the APPLE-II, II+ or IIe, Franklin, BASIS-108 or other APPLE clone to function as an intelligent terminal, at speeds of up to 9600 bps. It supports character/line insert/delete, memory lock, inverse video, and most other video functions, within the limitations of the APPLE video display being used. SOFTERM-1 does not support character/line insert/delete, however the character sequences to activate functions such as cursor movement, inverse on/off, clear screen, home, etc. can be specified to SOFTERM-1 to provide a crude emulation of some "dumb" terminals.

SOFTERM-2 comes with a card that plugs into any slot and which is attached to a 3 button (2 button for SOFTERM-1) auxiliary stick-on keypad. The keypad is almost color coordinated with the APPLE, depending on which revision you have. The cable is a 4-wire multi-colored job, ugly as sin, but if you hide it right, nobody will ever notice. The keys work similarly to shift or control keys and when depressed at the same time as a key on the main keyboard, it changes the meaning of that key. A handy (and needed) reference card is supplied to assist in sorting out the many possible functions. The system is supplied on two double-sided diskettes, unprotected. The system documentation is a 387 page phototypeset document which includes a tutorial, reference sections, several appendices including a glossary and a 10 page index.

SOFTERM-2 supports most serial/parallel/modem/clock cards offered for the APPLE. I have a lists of the supported devices, if anyone is interested, send me mail and I'll send them to you. For each of the different types of boards. Configuration is accomplished by a short menu-driven procedure to build a module taylored to the APPLE on which it is to run. A keyboard enhancer or shift modification is not required to use SOFTERM. By using the auxiliary keypad, all 128 ASCII codes can be emitted. However SOFTERM supports keyboard enhancers, the "1 wire shift key mod" and the "shift key attached to the video card"

modifications for generating upper/lower case characters. Of course the Apple //e keyboard is supported too.

In addition to providing a complete emulation for a number of popular terminals, it also provides several other advanced features. Any key on the APPLE keyboard can be mapped to emit any character code using the keyboard translate function. This includes control keys, as well as upper/lower case and specials. In addition, up to 36 keyboard macros (accessed by depressing two keys on the auxiliary keypad while depressing the desired macro key) can be defined. These macros can be used like programmable function keys to emit a stream of characters to the host, and they can also be used to control local SOFTERM functions, or a combination of both. It is possible to define a macro that with one keystroke (well, okay holding 3 keys down at once) will set up a terminal emulation, dial a host, logon waiting at all the appropriate spots, perform some functions and then go into terminal mode. These keyboard macros are in addition to any function keys associated with the particular terminal emulation.

Macro files are another feature of SOFTERM. These files allow a series of commands to be executed, either immediately or in "deferred" execution mode which allow the APPLE to communicate and exchange files with another APPLE or with any one of a number of hosts using either the "character mode", XMODEM or SOFTRANS protocols. All three of these protocols are available in a UNIX environment. The character mode is available with any host and allows specification of End-of-Block and Acknowledge characters and control of character/turnaround timing. The XMODEM protocol is an implementation of the CPM Christenson protocol, and functions in 128 character blocks. The SOFTRANS protocol uses an encoding technique to do data compression, parity checking and CRC checking with block retransmission on failure. Additional features of all three modes include the ability to translate CR->LF, LF->CR, turn the eighth bit on or off, expand tabs as well as other editing features. Since the SOFTRANS protocol runs without transmitting any "nasty" characters it can be easily implemented on a wide variety of mainframes. Currently supported systems include the VAX VMS and UNIX System-V on either 16 bit or 32 bit hardware, and Data General Eclipse AOS.

SOFTERM functions with standard DOS 3.3 disk formats as well as PASCAL and CPM formats. A Z80 card is not required to read CPM formatted disks. Incoming data can be directed to the printer or a disk file while it is being displayed on the screen. If output is going to the printer, it acts like a spooler if the printer is turned off or slower than line speed. About 16-20K of buffer is used for the printer or disk on a 64K machine. In addition, it is possible to copy the contents of the screen to print or to a disk file at any time. A handy function is the ability to display a status line at the bottom of the screen which tells if capture mode is activated, the status of the terminal and the current time or elapsed connect time. Some other bells and whistles include an automatic phone directory which saves not only the names and phone numbers of the systems you call but things like what speed they run at, parity, stop bits etc. You can select an entry from this little database and have it automatically dialed for you by the

program.

One of the best features of this package is that all updates are done directly from SOFTRONICS via a 24 hour 7 day on-line update service. The one exception to this is updating from the original SOFTERM to the new SOFTERM-2 which requires $50, the title page from the old manual and the label from the old diskette. Either the upgrade or the new version are available from:

For those of you with AZTEC 'C' who continue to try to build your bin directory (but perhaps are short of disk space?) I have modified the wc.c posted recently to run faster and to take up less space on disk. This was done by avoiding STDIO and using big internal blocking. It is also reusable with the 'run' command. The binary should take only 13 sectors rather than 32 as originally posted.

A couple of weeks ago I requested information about Apple compatible disk drives. I have received several responses by mail, and found a good article about Apple compatible drives in the September 1982 issue of Softalk ("Hardtalk", by Jeffrey Mazur, pages 208-211). I'm posting a summary of what I have learned because someone else out there might also find it useful.

This table shows the products I received comments on, and the number of favorable and unfavorable comments about each product.

Product	Positive Comments	Negative Comments
Rana drive	2	0
Rana controller card	3	0
Micro-Sci drives	1	1
Trak drives	1	1
Lobo drives	1	0
Lobo controller card	1	0
Call A.P.P.L.E. drives	1	0

From the article and comments I have learned the following:

1. To be safe, your first drive should be a standard Apple Disk II. This is the only way you can be sure to run any software, regardless of the strange protection schemes.

2. There are drives with faster and more precise head positioning mechanisms than Apple's drive. However, DOS must be patched to use the faster seek rates.

Without the patches, the disks use the seek rate for the Apple disks.

3. Any drive which offers more storage than the Apple disk (143K) requires patches to DOS. Without the patchs, the disk MAY run as a standard disk without access to the additional storage. (Useful if you need to generate a standard 143K disk copy.)

4. Current Apple compatible disks may not be fully compatible with the new soon-to-be released operating system.

Given what I have learned, I plan to get a Rana Elite Two for our system. We already have a standard Apple drive as drive 1. We need the greater storage capacity for some of our work, and given the cooperation between Rana and Apple recently to produce the MS-DOS box, I expect the Rana equipment stands a good chance of remaining compatible with future operating systems.

Thanks to everyone for your assistance.

I have an Apple IIe, with an 80-column card. I have already purchased the TranSend terminal program, but need to know what escape/control sequences will do the things a termcap needs to do to a terminal's screen. I haven't been able to get any standard escape sequences to work, nor the strange ones listed in the 80-column card manual. Users of TranSend who have solved

this problem are especially asked to reply.

If TranSend is hopeless, what is YOUR favorite terminal program for the Apple IIe?

a

Anybody have any experience with the Dow Jones software products? I'd like opinions, war stories, etc., on the News and Quotes Reporter, the Portfolio Evaluator, and any other products floating around. What are the prices, and are the products worth it?

     Thanks,
     John Opalko

I am thinking for purchasing a removable hard disk for my Apple //e. I
would appreciate any information and recommendations anyone might have
one different brand names and controller cards for them. I am interested
in one that can run the P-system,DOS, and Pro-Dos (when that becomes available).

Thanks,

Ron Breger

I have a Corvus 6Mb on my Apple //e and I am very pleased with it.
When it is configured under DOS 3.3, the workspace is divided into
37 volumes, each treated as a single floppy. You also get the
software to configure the workspace for pascal, with the advantage
that the volumes can be any size less than 5Mb. Or, you can configure
the disk for pascal, and then turn any or most of the disk into
DOS 3.3 format (as I have done), where when I boot up my system
it comes-up in pascal, I then can execute a program to go into
BASIC if I choose.

Rather than a removeable disk, the Corvus is a true Winchester, but
you can get the Mirror option that allows a backup of the system

to any standard VCR. The 6-megger takes about 13 minutes to backup,
and 13 minutes to verify the data.

I am looking forward for Pro-DOS, a great part of my work is with
Aztec 'C' and variable sized directories will be great with my
Corvus.

People who own Apples (of some variety) or are just interested in the
computer industry should try to get a copy of the Apple annual report.
It is very well written (I don't even own an Apple or Apple stock), and
has some nice hints about future products (visual page 7).

You can get a copy of the report from any stock broker or from Apple.

     Mike

An interesting thing about the Apple annual report is the front cover
illustration. It shows a graph with years as one scale (83-86). There
are various arrows going up the graph, but two are prominent.
The first has a little apple on top of it. The second, get this,
has the letters "IBM" on it. The two arrows look tied at about '85.
The other arrows all die out around '84. Then in '86, the is an arrow
coming in from the side.....with a Japanese flag on it.

From: Wanted: A good five-cent nickel <dosadi::binder>
Does anyone have a handy-dandy Applesoft routine for sorting text strings, as in a list of names for something like a phonebook? It should be programmable for the length of the substrings to be used in the sorting, and it must be faster than a straight bubble sort if it's to be of any use for more than a very short list.

Thanks.

Does anyone out there own a Apple ///?

I have one, and I'm wondering if anyone else has one of these paper weights. I would like to exchange ideas, programs, and whatever else you may have. I have written a terminal program in Pascal that I use to communicate with my UN*X system that I can offer for trade to anyone who has any public domain software they wish to share. I also have some screen entry routines that I use and may be useful to someone else.

NOTE: I don't wish to exchange (pirate) Copyrighted software, and I will not do so.

My system includes a /// and a Z80 card. I have Pascal Business BASIC (No I don't use it much), and 'C' for the Z-80. I intend to get the native mode 'C' as soon as Manix releases it, latter this month I'm told.

I originally purchased the /// intending to use it to make editing large Pascal programs easier and support my Apple][Pascal systems. After I received the /// I have found that it's not really very compatible with the][. I have been basicly using it for a terminal since. Perhaps the 'C' compiler will make things better.

If you care to contact me please reply via mail include your phone number and I'll try to give ya a call. If I get

overwhelmed with requests/information I'll post a general
letter here. I hope to have time to post any really useful
info on the network, however, I don't believe that there
are
enough /// owners to warrant the traffic.

Just a few questions to see if I can get any info.

1. Anyone have the double hires modification installed?

2. Anyone gona upgrade to a ///+?

Why?

3. Anyone tried to install the 65C02 processor chip?

If so do you know of any assemblers for it?

Thanks for any information.
Please contact:

Has anyone out there had any experience with the Vista Quartet disk system
for Apples? This system has two thinline double-sided 320k drives with a
controller. In their initial advertising they claimed to boot and run all
software that runs on standard Apple drives, as well as software with
operating systems modified to use the full capacity of the drives. This
sounds great to me, especially since I've seen them advertised for $570
including controller and OS modifying software. What I'd like to know is:

-are they reliable?
-are they really 100% compatible, including "protected" disks?

  -how well do their modifications to DOS, Pascal, and CP/M work?

Any information will be appreciated. I'll summarize mail replies if I
get any. Thanks.

I have been running Wordstar (3.3) under CP/M on an APPLE IIe driving
an EPSON MX80 using a Grappler interface. Recently, I have added a
DIABLO 630 and APPLE's Super Serial Card and have been successful in
driving the 630 from Wordstar when the super serial card is in slot 1
of the Apple. This required the removal of the Grappler a situation
I would prefer to avoid.

Ideally I would like to have the Grappler and Super Serial Card
installed at all times. I have been unsuccessful in getting Wordstar
(possibly CP/M?) to drive a printer connected to any slot other than
slot 1. Is anyone familiar with how I can do this or is it an
impossibiility?? Thanks!

My group need a cross C compiler running in Unix(tm) for MOS 6502/6510 microprocessor. We prefer that the output is in assembly language and a cross assembler is also available.

If you know any existing cross C compiler or cross assembler for MOS 6502/6510 or other 8 bit processors, please call, mail, or reply on net. Any lead will be appreciated. Your help will save us from scratching Steve Johnson's portable C compiler. Thank you in advance.

> We here at Dartmouth are requiring the freshmen to purchase Apple Mackintoshes when they enter next year. -- Richard Brown

Actually, Mr. Brown's information is off slightly. We here at Dartmouth are ENCOURAGING incoming students to buy MacIntoshes (pick your favorite spelling!), but it is NOT compulsory. As inducements to buy, Dartmouth is offering financial aid assistance, is wiring all dormitories for

access to our mainframes, and is gearing up to write interesting
software packages for the little beasties. We hope that people
will buy the machines because they seem fun or useful, not because
somebody forced them to do so.

Having discovered this wonderful good news, I feel compelled to pass it on.
One of the nastinesses possible with Apple Basic is the creation of a program
that is unlistable. But there's a way around the problem. Use the TLIST
command DSR's Diversi-DOS provides with its 64K version. I suspect that
Pronto-DOS and its TYPE command would work as well, but I am too thoroughly
satisfied with Diversi-DOS to bother acquiring the other.

I have a 25-Mbyte Tandon hard disk drive that I'd like to plug into my Apple.
I don't know just what it takes to do so, but I'd guess that a good start
might be the schematics and ROM code from the Corvus or some similar disk
subsystem. Given that info, I may be able to design a controller.

Does anyone have a set of Corvus documentation that he or she is willing to
copy for me? I'm willing to pay mailing costs, but I can't handle copying
fees of more than a couple of dollars. If you're in the same boat as I, i.e.,
having access to a disk but not a controller, I'm willing to share whatever I
come up with - it would be in the form of a wire-wrappable module built, most
likely, on an Apple proto card. My contribution would include schematic, wire
list, parts list, assembly drawing, cable documentation, and any other
necessary stuff.

Interested parties please reply by netmail or phone (617) 486-6363 between
8.30 and 5.00 Eastern time.

                    - Dick Binder

I am looking for a dot matrix printer which I can use with an Ann Arbor
Ambassador terminal driven off a main frame as well as with my Apple 2+.
The Ann ARbor requires an RS232 interface. My inclination is that the
Apple is most commonly used with a parallel interface & that I would be
better off with one. Can anyone recommend a dot matrix printer with
reasonable quality which has both parallel 7 serial interfaces? Is there
an external box which could convert the Ann Arbor to parallel? Finally
does anyone have a serial based printer running with the Apple2 who
could pass on personal experience?

I don't want to dampen your enthusiasm for home computer peripheral construction, but unless you are a senior analog electronics engineer, a high density disk controller (you said 25 Mbyte Tandon) is not to be attempted lightly. Besides the data rate (625 Kbyes/sec, peak) and the hassles with formatting, retry algorithms, CRC, ECC, and the rest (all of which CAN be handled by a bright digital electronics fan), the real bugaboo is what is called the "data separator" -- that portion of the controller which decodes the MFM code that comes off the disk (with LOTS of distortion and jitter on it) and separates the pulses into clock and data. This function requires a phase-locked loop with fast acquisition time, low noise, low jitter, stable tracking, high gain, and (last and worst) very low "static phase offset".

Even if you have somebody's schematics (ignoring legal questions), there's no guarantee you can tune the PLL properly. It needs AT LEAST a fast 'scope and a disk that is already properly recorded on, as well as some good luck with the noise and cross-coupling on that wire-wrap board you mentioned. (They don't make 'em with 4-layer P.C. boards for grins.)

Unless you are really sure you want the hassles, may I suggest that you simply buy one of the single-board SASI-to-ST506 controllers that are offered at single-unit prices of around $300 (from Xebec, DTC, Shugart, and many others). Thes cards typically include sector buffer memory, ECC/auto-retry, commands to format the disk, and other fun stuff.

Interface it to your favorite parallel port, and write a SASI driver for the parallel port (fairly easy). These boards are the same size as the 5-1/4" winchester disk drives; in fact, many drives and controllers

have matching holes to bolt them together. The disk drive power supply
(which you will need) can be selected to power the controller as well.
Caution: these things (both) draw bongo watts, compared to your normal
controllers/devices.

This is what we did while our own controller was being developed,
and I know of home users who have done the same. Depending on your
experience and resources, you could have it going in anywhere from
a few days to a few weeks.

Good luck!

Rob Warnock

I am a recent subscriber to netnews and have caught only a few followup
articles on the status of the "Soon to be released?"
 Macintosh. If anybody
has any good information on this machine, pleas respond.

Facts of interest:

1. Release date.

2. Cost.

3. Software packages available.

4. Distributors.

5. Operating System (esp. UNIX).

Thanks for you interest ....

{text saver}

I have an application for my Apple //e with two standard Apple][disks
which requires that I leave power on for days at a time. The disks are
used only for booting. My biggest worry is a power failure. If I take

the disk out of drive 1, the disk motor will spin forever when power comes back on. If I leave the boot disk in the drive, the machine will reboot itself when power comes back on, thus saving the motor, but I worry about leaving the R/W head loaded against the disk for long periods of time. Is this a valid concern?

I'd be willing to ruin a diskette to save the drive motor, but I don't want to ruin the head. (Sort of like robbing Peter to pay Paul).

Anybody out there have any good/bad/indifferent experiences with leaving floppies in the drive for days/weeks at a time?

    Thanks,
    John Opalko
    AT&T Bell Labs, Naperville, IL
    ...!ihnp4!iwu1c!jgpo

PS:
I'd *love* to buy a RAM disk emulator with battery backup, or (drool) a 20 meg Winnie with auto-retract, but I have all my $$$ allocated for luxuries like food, clothing, etc. :-)

A couple of years ago there was an article in Creative Computing (I think) called HEAPSORT, with a listing to sort a collection of numbers. I wrote a routine around it to compare strings pairwise, trying first the first letter, then the next, etc of the strings. Runs reasonaabbly well, and i think i can still find it. If interested, call me on 201-949-1871.

Well, I've had my Apple][+ for about four years and have had times
where leaving the machine on with diskettes in drives was a necessity...

The only problems I've had were an occasional blown sector due to the
Apple's power-up surge...and now and then a slightly warped diskette from
uneven r/w head and pressure pad tension..

If you have a large number of cards in your apple, and you want to leave
it turned on for extended periods, then a fan is an absolute MUST.
Before I had my fan, over extended periods my Apple's memory would
start to flake out..the only solution was to let the machine cool off for
a while.

          Good Luck,

Over the weekend, I wrote a program to simulate a guitar. I plays four
voice chords arranged in the same format as "bar chords" on a guitar with
a range from e to d#. The source is relatively short, but it uses a lot
(and I do mean A LOT) of data, so I have no objections to posting it
and instructions for creating the data (which is very time consuming) if
there is interest. As an alternative, if I'm am sent a BLANK disk with
a SASE (preferably a parcel) I'll send you everything including a very
rudimnetary editor for editing songs, which is due for an update to a

far more intelligent editor. (The first editor isn't even an editor. It
should be called a creator instead, since once a chord is entered, it
can't be changed...)

The playing program is all in assembly langauge, and
I refuse to put in any comments. That's too much of a pain at present.

If you're interested, send reply by mail, and I'll send you the source
and instructions or my home address.

P.S. The program requires absolutely no external hardware.

Here's a way I set up an apple][+ as a terminal:

1. Bought a smarterm 2.0 80-column board. 80-columns is a must if
   you're really serious. The smarterm is an excellent choice
   because not only does it give you an 80-column display, but
   it also has some smarts (clear-to-end-of-line,
   clear-to-end-of-screen, cursor-positioning). In addition
   it preprocesses the keyboard input to allow upper/lower case
   and a real-shift key if you attach one wire between the keyboard
   and the gameport (real easy, nothing to take apart). Finally,
   it allows you to type all those characters the apple keyboard is
   missing (_`{|}~[]\@). I love unix pipes | and pascal comments { }

2. Homebrewed a serial interface and modem. There are several
   you can buy, however.

3. Bought UCSD Pascal. A terminal emulator can be written in this
   language/system in just a few lines.
   Alternatively, many modems/serial intefaces come with the required
   terminal emulator (with or without smarts) in firmware or on disk.

4. Wrote a unix termcap to allow the apple to be used as a fairly intelligent
   terminal. This allows programs such as vi, vnews, and worms to be run.
   The termcap uses the codes used by the smarterm 2.0 board.
   Here's the entire listing, you may have to tweak the delays:

```
st|smarterm|smarterm 2.0 board for apple ][:\
     am:bs:cm=^^%r%+ %+ :co#80:li#24:cl=^L\200\200\200\200\200\200\200\200:\
     cd=250^K:ce=^]:nd=^\:nc:up=^_:ho=^Y:CO=^TC0:CF=^TC7:
```

To glen and klick,

I was unable to send you mail, so I have to tell you through the net.

Posting the source and techniques for data creation is probably not a
good idea. It was no fun when I made the data and I knew what I was doing.

I will more than happy to send you the program and a rudimentary editor I
you send me a floppy. If you have the SC 4.0 assmebler or the SC macro
assembler, let me know so I can send you the source also.

[]

  When I described the smarterm 80-column plug-in apple board, I mentioned
that it provides the ability to make the shift key work as a true shift key

for all letters if one adds the "standard shift key modification" wire. I received a request to explain what this is, and since it may be of general interest, I decided to post my response.

  The Apple][+ keyboard was designed to be upper-case only. Therefore, it only generates the upper-case ASCII codes. Several 80-column display boards allow lower-case and therefore wish to allow the user to use lower-case. One way which is often used by several 80-column boards and some application programs is to intercept the standard keyboard input (see KSW p. 84 of Apple][Reference Manual) and to preprocess the characters. Many boards allow a special character (often control-A) to be typed by the user whenever he wishes to change the case.

  Many boards also allow the user to make a one-wire modification to make the shift-key work right. This is what is known as the "standard shift-key modification". It allows the software preprocessing routine to "read" whether or not the shift key is depressed, and act accordingly. The wire connects the shift-key output to paddle-button-2 (PB0,PB1 are used by many games and connected to many joysticks/paddles; PB2 is usually unused). The keyboard preprocessing routine can then read the status of the shift key by reading $C063.

  This modification is supported by several 80-column cards and some other application programs, read your manuals!

HOW TO DO IT:

  - Open up the apple top, look down into with the keyboard side closest to you.

  - Locate the board directly under the keyboard. It stands above the mother board. It may be marked "Encoder Bd. Apple II"

  - Locate the connector on the right side of this board. It has about 25 pins.

  - The second pin from the right is where one end of the shift-key mod wire goes. Connect a wire to this pin.

  - Now locate the game-port socket (that's where the joysticks/paddles plug-in)

  - Pin 4 is where the other end of the shift-key mod wire goes. This pin is in the right row of pins, fourth from the bottom. Connect the other end of the wire to this pin.

That's it! Now most boards will automatically use the shift-key correctly. Other boards may require that you type a certain control-character to initiate the modification.

  If you aren't the hardware hacker type, many computer stores will do this modification for you.

In a very expensive looking Super Bowl commercial
Apple announnced the Mac for January 24th. No details
were given. The commercial itself was interesting in
that it was styled very much like the movie `Alien', and
was a direct play off of Orwell's 1984.

If anyone out there knows anything about the VIP card besides what the
manual says(which by the way doesn't say much), please let me know about
it. I am trying to get the card work with SOFTERM(a terminal emulator)
on my Apple //e. One thing I need to know is that, is the VIP card
compatible to any other card and if so what other card(s).
Please send me mail at

     seismo!rlgvax!cvl!nk

Thanks a lot.

     Well, after months and months of waiting I finally got a glimpse
of the MACINTOSH. While I was extremely impressed with what it could do,
I was also dissappointed by what it couldn't do.

     What I mean is ... with no internal slots, and as of yet (to the best
of my knowledge) no means of programming the machine, (and more appropriately

the mouse, and 68000 MPU) it is not quite the dream of a hacker ... or even an experience programmer who likes to see himself tested once in a while.

I don't know .. is it just me, or does anyone else out there have similiar feeling on the subject. I would really like to here from anyone who has seen the MAC and gotten either similiar, or different feelings.

Respond either by mail or via the net. I think the topic is applicable.

Thanks,
Len Armstrong
St. Joseph's University.

What one should take into consideration about the macintosh before attcking it from the hacker aspect, is that Apple is not trying to put out machines for hobbyists anymore. The macintosh is supposed to be the first generation of very easy to use, friendly machines. This does two things. It spreads the use of the computer to a wider audience. That's the positive part. The bad part is that the gap between a user and a programmer is ever widening. I think the end result may well be, to a large extent, two groups of people: People who bothered to learn programming before user friendly machines (and will probably be money makers) and people who are whizzes at using what is created for them (these people will probably be managers). Its a little pessimistic, sure, but it seems that Apple is telling less and less about its machines.
  I wanted to work with graphics on someone elses apple ///, but the manuals said close to nothing about how the screen is memory mapped. Its fine for the businessperson, but not programmers.

I called an Apple technical line yesterday and they confirmed that several compilers are in the works for the Mac. Third party software developers can get the specs needed to access the graphics -- its an 800 page book. The unit does have some *expandability* -- you will be able to replace its 16 64k Ram chips with 16 256k chips taking the unit to a half meg.

At least two third party outfits will be offering hard disks for the mac.

All in all the mac's future doesn't look that bad -- remember what the IBM PC was like when it came out.

The Mac is just what the doctor ordered for millions of would-be computer users. Apple has really got its act together on this one. Journalists seem to be spreading all sorts of disinformation such as: no keybad, not expandable, no hard disk, not IBM compatible, etc. I predict the MAC will be the apple II all over again. Apple will be selling lots of these machines and users who are not computer scientists will at last have a computer that they can relate to.

I think the screen is big enough, a keypad is optional but obtainable, hard disks will be available, some expansion will be allowed, a great deal of 3rd-party software, including games will be available, it will be IBM-compatible, hard disks will be available and Apple will meet the challenge that IBM presents. IBM, where only the janitors are creative, will have to bring out something to compete, and then will act like they invented it. Anyone who doubts the viability of Apple has their eyes closed.

NEWSWEEK states that the Mac case cannot be opened by the user. (I guess that means withjout hacking up the plastic). So much for hardware hackers!
The irony is that the 40-odd designers of the system got to sign their names on the case injection mold die, so if you broke one open they'd be famous (to you, anyway). Is this more "disinformation?" And say, there are a couple of expansion slots, I hope? There better be, for Winnies, music synthesizers, and all the other ad-ons that made the Apple II series so great.
     Let's face it: if you removed the expansion bus card slots from the Apple II, you'd be left with TRS-80 Color Computer except with an inferior microprocessor, lower-level integration, and a 6x price tag.
Apple Co. ought to know the value of 3rd-party soft AND hard ware. mike k
PS: For introducing 3 years olds to computing, I can't imagine anything better than a Mac running the appropriate icons thru the mouse. Kid wouldn't even need to read -- just "point & touch."
Let's hope this great box isn't wasted on businesses.

Before all the hackers go running off yelling about the Mac's lack of
expansion slots, etc., remember that the Mac has a big brother: Lisa II. The
rumored price sounds right ($3500 w/o hard disk, $5500 with), the memory is
expandable, and there are stories of Unix and C compilers, if that's your
thing. My local dealer says that Lisa II will be shipped to dealers
in about a month.

I recently purchased some software that is copy protected.
Does anybody have a way of backing up copy protected software on the
apple. The software in question runs under the UCSD P-system.

Thanks,
David Custer

To r2d2:
I couldn't get mail through to you, so I hope you pick this up.

I realized that it would be a waste of both my time and my time to post
the source and the technique for creating data for several reasons.

I am willing, however, to send you the program and a rudimentary editor
if you send me a blank disk and a sase with return postge.

Also note if you have the SC 4.0 or the SC macro assembler so you can have the
source code also.

People seem to be forgettin the 2 megabit port on the back of the Mac!

What this provides, among other things, is an easy and generic hookup for
darn near anythin, including a card cage.

If there were internal slots, there would also be twice as much power
supply to serve them and a fan to cool it. More cost, size, and noise.
Even tho i like to add features, I'm with Apple!

On the other hand, why are computer manufacturers compelled to mess up
keyboards? Happens to all of them.

First: I don't copy every game i get my hands on but I know a lot about copying
because I backup a lot of my own software and some of my friends for them.

There are only two ways people copy software. One is with software and one
is with hardware. First the software.

      SOFTWARE

1) LOCKSMITH 4.1 ($80.00-$100.00) - Just for copying.
2) COPY][PLUS ($39.00)   - A full DOS system including
                                    disk copying and disk organizing.

both of the the programs have with them copy lists and instructions how
to copy them but i recommend the copy program COPY][PLUS.

      HARDWARE

There are many hardware boards used for copying but the problems with
such boards is that they can only copy TOTAL LOAD programs. WHat i mean
is that if the program loads itself in and then runs without ever using
the disk again then it is a TOTAL LOAD program. The boards are almost
useless on most good software but they are still there and run about
$129.00 to $300.00 .

 I hope I have helped you. If you have any questions you can mail
directly to me.

   Josh Siegel

I presently own an APPLE II+ computer, a California Computer Systems CPS
card, and a 300 baud modem (Radio Shack Modem 1).
I have copies of ASCII EXPRESS and VISITERM 1.1.
What is the best way to communicate with UN*X?
Any termcaps and/or suggestions out there in net-land?
Any help would be greatly appreciated, and results will
be posted to the net.

Thanks a lot for your time,

--

My local dealer already has Lisa 2. His retail price list is:

```
         LISA 2        $3495
         LISA 2/5  $4495
         LISA 2/10 $5495
```

All these have 512k RAM and the 400K microfloppy. The /5 and /10 refer to 5 mb or 10 mb hard-disk. The 5 is external and the 10 is internal and uses the one parallel port. 1/2 mb RAM expansion is $1495.

The documentation (system overview) claims Microsoft XENIX and UniPress UniPlus+ are available. I assume C comes with them, at least with XENIX. It also claims "MS-DOS (future)".

The Lisa 2 is capable of running Mac software, so it looks like an excellent prospect for Mac software development. From what I've seen (which isn't much) the standard Lisa OS is well suited for this kind of development with their Pascal package. It would be nice if there was a C compiler available under the Lisa OS, too.

I would suggest reading the new magazine Macworld (Premier Issue) that recently came out. It is loaded with information about the Mac and why it is the way it is. My impression is that the Mac is the neatest thing since the release of the IBM-PC. And I am one that thought Apple was all washed up!

A followup to my previous letter, "Bits About Mac"

> Mac documentation is excellent. I glanced through the manuals and they've got something for everyone, hackers included. Some are very elementary, but a bunch give good inside data (more of which is to come). One of the great things about Mac is that, from a users standpoint, you don't have to read a single word to operate it. My friend told me to "click the mouse button twice" and from there on I was home free.

> Here is an amusing excerpt from BYTE in an interview with Steve Jobs, Andy Hertfeld, Bill Atkinson, and the other wizards who developed the computer:

> Smith: The diagonal lines look better, too; the jaggies are removed somewhat, and things like that. So, with that, we said, OK, what's that going to mean? And we ended up with 128K and...
> Atkinson: 22K bytes on the screen, and in a 64K machine you couldn't have afforded it. That drove us to 16 RAM chips instead of 8.
> Hertzfeld: By then, we knew we were going with 128K bytes anyway, to run the applications.

> Jobs: I just though I'd show this to you. This is the IBM video board; it's only video, nothing else. It's 69 integrated circuits, more chips than an entire Macintosh, and it basically does nothing. And it doesn't even do that very well.

Jobs is right. The Macintosh disk controller is one chip. And IBM is really going to get blown away by this computer. So is everyone else who has nothing but a name behind their name. No, I am not a salesman from Apple. I am a long-time Apple II owner, but this computer is really superb. IBM's PcJr is a peabrain, not a peaut, with a keyboard made with surplus Radio Shack calculator keys. The IBM's graphics are colorful but not as crisp as the Mac's. Compared to the Mac, everything else is SLOW! Ever tryed to make an Apple II delay in assembly language? Loop to 65,536 for a short delay. And the Mac's AVERAGE speed is 6 times as fast as the Apple II's, besides having far faster routines.

Okay, the microprocessor is not a true, true, 32-bit, its a restricted, yet enhanced 32-bit (no doublethink there) But the IBM isn't really a 16-bit, either. If you really look at it, it has a lot of 8-bit characteristics.

Conclusion: The Mac will be a success. Not might be or should be but will be. Apple is installing them by the umpteen (too early to get raw figures) in universities and if the activity in my local store is indicative of sales nationwide... Every few days the store gets 8 Macs. As soon as they get them they are out the door.

The only reason NOT to by one is that Apple has even more amazing stuff up its sleeve. But I wouldn't wait if I had the money.

During the development of the Macintosh I was in contact (through a friend) with some people at Apple, and I have been long awaiting its arrival. I fooled around with this amazing machine-on-two-boards in a local computer store and it blew me away. A man with a little kid came into the store, asked me and my friend about ten questions, played with the computer for five minutes, bought one, and walzed out the door.

Anyway, I read the Feb issues of Byte and Softalk and they provide a wealth of interesting information that I haven't seet on the net...

> The 3 1/2 inch disk drive stores its 400K in an interesting manner: Unlike the Hewlett Packard drive, which stores 270K in 70 tracks with equal amounts of data on each track, the Macintosh drive uses 80 tracks with MORE DATA ON THE OUTER TRACKS. This is possible using software controlled disk speed.

> Mind you the disk that the Mac uses is only single-sided. It may be possible to use a double-sided drive that would store 800K. Apple may be planning on this.

> The 64K of ROM contains lots o' good stuff for programmers: To sum them up from BYTE...: Resource Manager, Font Manager, Quickdraw, Event Manager, Toolbox Utilities, Window Manager, Control Manager, Menu Manager, Text Edit, Dialog Manager, and Desk Manager. Sorry if that's not too descriptive but there are so many routines in each... What is basically means is a standard for future programs, and smaller programs that don't take up

precious RAM space (128 K of it) for screen/memory/mouse, etc. routines.

> Graphics are 512x342 pixels, and there's gonna be a laser printer that will print in color.

> Software soon to come: Pascal, Assembler/Debugger, BASIC, Logo, and LOTS of stuff from other companies. I know that the Zork adventures are coming from Infocom, and other games, not to mention business programs.

More stuff in: "More Mac Bits"

No, I am not a salesman from Apple. I am a long-time Apple II owner, but this computer is really superb. IBM's PcJr is a peabrain, not a peanut, with a keyboard made with surplus Radio Shack calculator keys. The IBM's graphics are colorful but not as crisp as the Mac's. Compared to the Mac, everything else is SLOW! Ever tryed to make an Apple II delay in assembly language? Loop to 65,536 for a short delay. And the Mac's AVERAGE speed is 6 times as fast as the Apple II's, besides having far faster routines.

Okay, the microprocessor is not a true, true, 32-bit, its a restricted, yet enhanced 32-bit (no doublethink there) But the IBM isn't really a 16-bit, either. If you really look at it, it has a lot of 8-bit characteristics.

Conclusion: The Mac will be a success. Not might be or should be but will be. Apple is installing them by the umpteen (too early to get raw figures) in universities and if the activity in my local store is indicative of sales nationwide... Every few days the store gets 8 Macs. As soon as they get them they are out the door.

The only reason NOT to by one is that Apple may have even more amazing stuff up its sleeve. But I believe that new stuff will mostly be improvements/updates on the Mac/Lisa 2s, networking between them, lots of Apple and lots of 3rd party software, their portable IIe (May?), their double ultra-thin disk drives for the Apple IIe (for use with portable, ?) and stuff like that.

I have just ordered an Apple //e system (128K, 2-drives, ImageWriter
printer, Micromodem //e [300 baud], and the Apple Mouse [when
available]).

I am going to use the system for developing a graphics application
package that I am doing for my Masters Thesis. I need some information
about software. I would appreciate any recommendations.

    + I want a word processor; I also would like a "screen editor",
which I could edit raw files that could be transferred back and forth
between my system and UNIX(tm).

    + Programming languages; I am interested in using Forth or UCSD
Pascal.

Finally, I am interested in some general software (not for my thesis)
such as home financial and tax preparation software.

         Thanks,
              George V. Wilder

I want to get a CP/M card for my Apple //e. I know about the Microsoft card. I would like more info about cards that have 64K memory on them. Do any of them allow co-processing with the 6502. I have heard of two such cards (that have 64K memory); the PCPI and ALS cards. If you have one of these cards (or other CP/M card with 64K memory), I would like to hear about your experiences with them. I will post a summary to the net.

     Thanks,

[If you read this, you'd be home now (?)]

     In response to Kenn the Kenf's request for Macintosh info:
     We at Dartmouth aren't exactly swimming in documentation. The first two Macs showed three days ago; we are still short on hardware, development software (and developers!), and especially technical info.
     The only really interesting thing I haven't seen in print is that it comes with a cassette and demo diskette to teach you the basics -- a nice demo, well-narrated. MacPaint & MacWrite also come with a cassette; I think most packages won't.
     Check out the latest BYTE, not yet at the stands I think. Personal Computing is OK, but BYTE was more in-depth, with more technical stuff (eg, memory map). Two (!) magazines are out: St.Mac [sic], which looks

blah, and MacWorld, which is good, though it seems more aimed at new users. There are also 3 books in ads, 1 or 2 of which are already out; one is by someone from the Apple's Mac team. I'd be interested if anyone could review these?

There is also an brochure of some 20 pages, which will be in magazines in the next month or two. Apple dealers may have these to give out; they're worth seeing, if only for the mind-blowing graphics. (N.B.: the Japanese woodcut was digitized, not Macpainted as implied!)

It sounds like hype, but you must see and USE the machine to really understand it. Photos in brochures just aren't the same, and don't show you how the elegance or speed, which Lisa-users will love. I hope your Apple dealer doesn't have too long a line of people waiting to see it...

More specific questions?

There seems to be a lot of software around for backing up "copy protected" software. As far as I know, no single systems works with everything, at least not easily. Locksmith seems to be the oldest and does indeed work, but entails the setting of obscure parameters (I haven't seen the new v5.1 yet, so maybe it is better). Unless you have the correct parameter setting for what you want to copy, or a LOT of time, forget it. [It tries a bunch of defaults automatically, but they rarely work with the "newer" software. Maybe this is simply because locksmith has been around so long that implementors have learned to circumvent it.]

Super copy (v4.7 or so) seems to do very well without any manual intervention. I am not sure if it allows special settings for the real nasties.

I have found "nibbles away (II)" to be very good. I have even

seen special formatting disks which allow you to load the
copy parameters for various programs. In addition, one
can set the backup parameters via a menu. In all, this seems
to be the most flexible and easy-to-use single program. On the
other hand, if you don't have p-rameters for it, it too
is not certain to work.
  It the software you want to backup uses nibble counts, it may
prove very difficult to backup effectively regardless of what system
you use. [This is a protection systems which determines the speed
of the floppy drive used to make the recording and "knows" what the
speed for the original was.]
   Greg Dudek
P.S.: why bother anymore; don't most distributors provide a
free replacement copy if the original fails anyhow?
PPS: This stuff works with pascal diskettes too.

I am looking for a word processor for the //e. I have the basic (non-
expanded) 80 column board, an Apple Dot Matrix Printer and a Grappler+
board. I would like a vi-like editor, preview capability, use of all the
//e features, text justification and the ability to use the DMP's
proportional text fonts.

Two packages which sound promising are Zardax and Guttenberg. Has anyone
used either program? I would also be interested in learning about any
other word processors that might fill the bill.

                        Thanks,

Does anyone know anything about the new operating system for the Apple IIs? I just finished reading the articles on personal computers in this week's Business Week (dated Oct. 3). One of the articles is about Apple Computer and their moves to compete against IBM. A picture shows both a Lisa and Apple //e. The //e has windows, icons and a mouse just like the Lisa! The article mentioned the new OS was expected by January '84.

Let's start the questions.

- Does it require a hard disk? (If yes, then maybe its really MacIntosh.)

- Are they planning new drives or disk formats for the IIs?

- Will the new OS run on the old II/II+? (Maybe it will require hardware additions for the older machines?)

- What will be its compatibility with DOS 3.3 (II;II+;//e), SOS (///) and Lisa's OS?

- Will there be an integrated package of software like the Lisa?

- What languages will be available under the new OS?

- How much will it cost?

- What other questions should I ask a dealer when I finally see the new OS?

I'd appreciate hearing whatever anyone else knows. Have there been any other mentions or articles about the new Apple OS? (P.S. Anyone that thinks I've got room on my desk to push around a mouse has another think coming!)

My first thought at reading Wayne's letter was that he did see a MacIntosh.
Also, what I have heard is that MacIntosh's will NOT have hard discs; they
are a ~$1K machine with one or two mini-mini (4") Sony floppy disc drives.

Apple has announced a new operating system for the Apple II series, but I have not heard anything about windows or icons being involved in the new system. Possibly the press releases in Business Week may have confused the Apple II with the MacIntosh. On the other hand, it is quite possible that independent software developers have done some interesting things already with the new system.

The new Apple II operating system is called ProDOS. According to a story in InfoWorld, July 18, 1983, the new system will not be available for retail sale to users until early 1984, but Apple is now licensing the system to software developers for application development. Some commercial programs using the new system should start appearing soon. Some features of ProDOS (according to Apple):

1. Apple III - style file structure (Hierarchical File structure, file naming and data formats are those of Apple III SOS -- Sophisticated Operating System).

2. Ability to move ProDOS data files and data disks between an Apple II running ProDOS and an Apple III running SOS. (Only data files, not programs, are interchangeable)

3. Ability to handle files larger than 143K (the capacity of a disk).

4. Support for interrupt-driven processing, for networking and data communications applications.

5. Faster response to keyboard commands.

The new system is not intended to replace any of the existing Apple operating systems (DOS 3.3, Pascal, or SOS) -- all will continue to be available, says Apple. ProDOS itself will be available only on the Apple II, not Apple III. No hardware changes are needed on any Apple II that has at least 64K of "internal memory" [presumably meaning RAM?]. ProDOS-based applications written in Applesoft BASIC will run on an Apple II Plus or IIe. Those written in assembly language will also run on the old Apple II. The current Disk II interface will still work.

I have heard of programs to measure the speed of apple disk drives
which are used to calibrate the drives. Is there such a program in
the public domain, or can anyone describe how such a thing would work?

Thanks,
Greg Cury

Would anyone who has information on a hard disk and/or
networking (shared resources) hardware/software for
the Apple please reply by mail to: Thanks in advance.

Does anyone have any experience with the Franklin AcE 1200?

If so, I'd appreciate hearing and will post a summary to this
group if it is interesting.

Thanks...

My son's school recently received an Apple IIe computer and I am working
with his teacher to set up some educational programs, such as for math,
spelling, social studies, etc. We have logo & applesoft basic. Does
anyone have any programs that might be appropriate or that could be
adapted? Thanks.

Does anyone out there in Netland know where I could get a 6502 disassembler
running under the P-system on a Apple][? It would be nice to get a P-code
disassembler as well.

#
#This entry assumes that you are using an apple with the UCSD Pascal

```
#language card.  SYSTEM.MISCINFO is assumed to be the same as that
#supplied with the standard apple except that screenwidth should be set
#using SETUP to 80 columns.  Note that the right arrow in not mapped in
#this termcap entry.  This is because that key, on the Apple, transmits
#a ^U and would thus preempt the more useful "up" function of vi.
#

Dear Dennis,

I have a Franklin Ace 1000 (which is an Apple II+ clone in case you
don't know) with a Franklin 80 column card.  I also purchased ASCII
EXPRESS "The Professional" from Soutwestern Data Systems which includes
stuff for file transfer, printing, and other things as well as terminal
emulation.  It is a well done piece of software and is worth the price
(~$90 in BYTE).  However, along the way I have hacked a termcap entry
for the native hardware that works well even without the emulation
software running.  I don't know if the Videx 80 column board is the
same as mine though.  Contact me if I can be of further assistance.

Here is the termcap entry:
xx|frank|Franklin Ace 1000:\
     :bs:bw:cd=^K:ce=^]:cl=^L:cm=^^%r%+ %+ :\
     :co#80:li#24:nc:ms:nd=\034:se=^N:so=^O:up=^_:xr:

Dennis:

     I use the following termcap with ASCII Pro Express communications
package (~$125.00 and well worth it!). I bought it after several
attempts at writing and testing homegrown termcaps--all unsuccessful.
Termcap follows:

```
|apple|Apple II+ running ASCII Express Pro--vt52:\
      :bs:\
      :co#80:\
      :li#24:\
      :up=\EA:\
      :nd=\EC:\
      :ce=\EK:\
      :cl=300^L:\
      :cd=\EJ:\
      :ho=\EH:\
      :cm=\EY%+ %+ :
```

I configure .profile as follows:

```
stty erase ''
PATH=:/musr2/lbin:/bin:/usr/bin
export PATH
PS1='=ptah=>'
echo 'TERMINAL?: \c'
read TERM
case $TERM in
  apple)
        TERMCAP=/musr2/mww/apple.tcap
        export TERMCAP
        export TERM
        ;;
      *)
        TERMCAP=/etc/termcap
        export TERMCAP
        export TERM
        ;;
esac
```

Good luck,
Mike Warren

I am looking for info on P-code systems for 6502's.
If anyone knows of any literature on P-code systems in general
and their definitions please let me know by mail or publish
a list of where I can find such literature.

Thanks,

Jim Rankin

I have been using the following termcap for my Apple][+. It requires
an 80 column Videx (or lookalike) card. This version uses the reverse
character set eprom which may not be on all cards. The 250 delay for
cl is a little long and you might be able to shorten it.

This is my first try at a termcap. It seems to work fine, but if anyone
has any suggestions I would appreciate them.

P.s. Hello Dennis!

Am looking for PROLOG to run on an Apple.
Does anyone have information on availability?
Please mail any info you may have

thanks
Taylor Jackson

I am thinking of buying a printer for my Apple //e. I'll probably
get the Grappler+ interface, and am trying to decide between the
Prowriter and the Okidata 92. Several people at work own and love the
Prowriter, but the Oki's print quality looks a bit better (at slow speed).
Consumer Reports said the Oki was one of the best printers they tested,
but they didn't test the Prowriter, unfortunately.

Does anyone have any experience with either of these printers? Also,
would anyone care to comment on my choice of interface? The Grappler+
looks pretty good to me, but I'm always open to suggestions.

    Thanks,
    John Opalko

    Some time ago I was also comparing printers for the Apple
//e. I found the Okidata 92 to be a much more useful printer. While
it was a little more than the Prowriter (I think), it seemed the
better buy. Actually, I was buying the printer for my parents, so
I also wanted something I could trust. So far they have not had
any problem with it. It also has one of the best "multi-strike"
fonts I have seen on a dot-matrix printer. I strongly recommend the
Okidata.

Thanks to everyone who took the time to advise me on which printer/interface
to buy for my //e. I just went out and bought a Prowriter and a Grappler+
interface card. General consensus was the Grappler is a darn good interface
and the differences between the Prowriter and the Okidata 92 (wrt print quality
and features) are minimal. The Prowriter, however, was considered to be more
sturdily built.

Once again, thanks for all the help.

[From the virtual flamethrower of ZBEN]

I am sorry to have taken so long to post this information, but I wanted to ensure its correctness.

Before we start, I should mention that the popular commercial utility programs "Locksmith" and "Nibbles Away" both contain extensive disk speed tests, full media verify, etc. They are available in the $50-$100 range.

There is a disk speed program on Volume 1 (Utilities 1) of the Washington Apple Pi (WAP) library. This disk is in DOS 3.2 (13 sector) format but my brother assures me that it MUFFINs over to DOS 3.3 (16 sector) format very nicely. There is a binary (BLOAD) file and an INTEGER basic driver. This may be a problem for those with Apple][+ machines without language cards, but if its the usual BLOAD and leap to it program it shouldn't be too hard to gerrymander an Applesoft version.

To order disks from WAP send a request to the following address:

Washington Apple Pi - ATTN: Librarian
8227 Woodmont Avenue, Suite 201
Bethesda, MD 20814 U.S.A.

Please allow 6-8 weeks for delivery. There are several hundred disks available in the WAP library. Disk prices are:

If mail-ordered:				
1st five disks of order	members:	$7.00	nonmembers:	$10.00
remainder of order	members:	$5.00	nonmembers:	$8.00
If picked up at office/meeting:	members:	$5.00	nonmembers:	$8.00

The WAP is a large user's group with international membership. I checked the last directory, of the non-USA members there were: France:2 Belgium:1 Canada:5 England:1 Thailand:1 Saudi Arabia:1 South Africa:1. Dues are $25 for the first year and $18 for subsequent years. Those wishing to join are urged to send to the above address, ATTN: Membership, for membership application forms.

Dave Newkirk writes of Apple Pascal:

  "It is a good implementation of the language, lacking only the NEW() function for memory allocation."

  I agree that it is a good implementation of the language, but NEW() works just fine on my Apple Pascal 1.1 system. I suspect he meant that DISPOSE() is not implemented, which is true. There are MARK() and RELEASE() procedures offered as a partial substitute.

I have been trying to convert vcalc files to an apple compatible (visicalc) format. Does anyone have a set of filters for converting files back and forth? The format appears to be similar, but my attempts thus far have not been successful.
Any pointers would be appreciated.

Thanks,
  Kent Springer

Why does write protect switch connect to motor phase 1? So the DOS can
test for write enable? How else would it know not to try to write?
I recommend a close comparison of the controller and disk schematics from
the DOS manual with a copy of "Beneath Apple Dos", with particular
attention to the coding sequence given for "testing write protect"...

No-the New() procedure does not work properly in Apple Pascal.
Memory must be allocated using New() and released in a particular
order or disastrous results are likely to be achieved. The
implementation of new should be user-transparent and it is not.
Apple Pascal does not keep an available list of free memory for
new-just as the they do not dynamically allocate strings-another
weakness. I still like the implementation, however.

subject:software piracy-coupons and other methods.
     Jonathan A. Chandross (BTL MH)

     As a software pirate I was bemused to read of the new
methods which you people seem to think will stop software piracy.

SOUNDS LIKE THE METHODS CURRENTLY IN EXISTANCE (ALMOST).

     The methods currently in existance are:

     1) Non-standard DOS (disk operating system)
        This means that the disk is written in such a way that only
           the companies load routines can access it.

     2) Nibble-count
           The number of bytes on a given track (or tracks) is known.
        When a copy is made, the number is different, and the progran
        senses this and refuses to boot, erases itself,.....

     3) Serial numbers
         Removing serial numbers is so trivial that it doesn't even
         bear mentioning.

     I have little or no trouble removing the protection on these
disks. There are other methods, but they get complicated to explain,
and I don't think that this is the time or the place to explain them.
What my friends and I do is allow the program to load, and put it on
a normal disk after removing nibble count checks, DOS checks .....
In other cases (ie non-total load) we merely transfer all of the files,
or copy the disk preserving the nibble count.

     Any time that someone comes out with a new method of protection,
it is usually out on the streets stripped of its protection inside of a
few months. I happen to think that these guys (meaning the proponents
of the system) don't know what the Heck they are talking about.

Putting on "bad" sections on the disk is no problem to remove.
I know of one game which uses them. It took about 20 minutes to strip
the protection off of it.

We had a "dinosaur" user who got the same type of diagnostic. His program
turned out to be one 4000 line procedure! (Yes, he was an EE...) I got
the same diagnostic on a monster case statement later that year.

Isn't this really a problem with the release function? I had understood
that standard Pascal didn't HAVE a release function. I have always
programmed a free-list routine so records of each type might be reused.

    I'm almost glad I made the mistake of switching NEW() for RELEASE()
    or I would not have seen how many other people use Apple Pascal.
    I don't like everything about it, but it a good implementation
    for a micro as old as the Apple II. Some more info on Apple
    Pascal can be found in old net.micro.apple messages.

Tired of having to look to see which light turns on when you do an 'ls' command. Do your fingers keep typing 'pwd'? I have posted a copy of my 'pwd' command to net.sources for your usage for what its worth.

One of the first things that I got tired of with the AZTEC system was the inability to find out how much space was remaining on my disks. I was constantly running out of space when trying to do compiles. I also missed the sorted directory lists produced by the UNIX ls command. Since it is not *easily* possible to replace the builtin AZTEC 'ls' comman, I wrote a new one: 'dir' that allows wild cards '?', '*' and character classes as in '[...]'. It produces a sorted list in either 1 column or 2 column mode. Control characters imbedded in file names are expanded to '^x' and the optional '-l' option shows lock status and file type as well as file size (in characters). The program automatically pauses at the end of each screen unless the -p option is used.

I can't believe that I'm the only one out here writing stuff for the APPLE AZTEC system. If anybody else has programs of a general nature that run on it, please post them or send me mail if you're just interested in a second opinion. C'mon, this system is *GREAT*... now if it only had a decent shell, and a better editor....

I am posting a listing of my 'dir.c' program to net.sources. Please feel free to add it to your APPLE software tools library.

I have had my Apple][+ for about four years, and for the last three I have used Apple Pascal (AP). AP is by far the nicest OS available on the Apple, however that is not to say that it doesn't have its problems. AP is Apple's version of the UCSD p-machine, A software simulated computer that runs p-code. Supplied with AP is the Pascal language and a development environment which includes a screen editor, a file handler, an assembler (6502 for the Apple), a linker, and a variety of library routines and utility programs. Considering that the only alternative until recently to AP was Apple's DOS 3.3 (DOS), a pitiful excuse for anything (let alone an OS), AP was by far the choice for software development. Here are the pros and cons of AP as I see them.

The Pascal language (compiler) as supplied with AP is very powerful. Except for the lack of a dispose function, the Pascal has all of the features found on mainframe implementations. I have on occasion written programs in AP and phoned them in to Maryland's Univac 1100/80 (dinosaur) having them run with little or no changes. AP has real file handling as opposed to DOS's ctrl-D garbage. Units, which are very much like Ada packages, are supported. Linking of externally compiled/assembled routines is supported. What else could you want in a language ?-). The problems voiced in the net about compiler error #253 (Procedure too long) is overstated. If a procedure is generating more than 600 words of code, it should be more than one procedure. AP is not the only Pascal that gives a procedure too long error. Pascal/VS running on Maryland's IBM 4341's also does this (not at 600 words though). Many students taking introductory computer courses here have run into this error when they tryed to place all of there code (about 50 writelns) into the main program.

The editor supplied with AP is a full screen editor. While it doesn't have a lot of the nice features found in other editors, such as macros and programmable tabs, it sure beats Applesoft's

esc-sequences. The only other problem I have with the editor is its size limitation. The maximum amount of text it can edit is about 20k. The editor and the compiler work nicely together. If the compiler catches an error in your program you can have it put you in the editor write where it caught the mistake. This works most of the time, except when you start using a lot of include files.

The file handler is called the filer. It is used for copying, deleting, and renaming files as well as setting the date, setting default volume names, etc., and it has wild cards. The file structure used in AP uses contiguous blocks on the diskette. This means that the disk must be K(runched whenever free space is in lots o' little patches. People have complained about this. They have asked why must AP do this when DOS doesn't. The answer is speed. Haven't you ever wondered why AP I/O is Soooo much faster than DOS I/O? The "BASICS" disk provided with DOS and AP for loading the language card with the basic not in ROM uses AP format. That's why it can load the language card so quickly.

The assembler provided with AP is very nice. It supports macros and everything (golly gee). My only problem with it is that it assembles 6502 code. More on this later.

For the $295 it costs (I believe that's the cost for just the software), it ain't bad. It does require 64k of RAM, and if you don't want to go crazy, you should have two disk drives. My problems with the system follow. It's slow. Slooooooooow. 6502 (8 bit brain damaged micro processor) running at a measley 1Mhertz + a software simulated machine on it = slooooooooooooooow. The other big problem I always run into is EXEC ERROR #4 (stack overflow). The only answer to this is to segment and swap procedures. This leads to (you're not going to believe this) slower execution time. I really hate waiting 20 minutes to get a stack overflow right before getting the output. These problems really aren't with AP. They're with the semi-evolved brain damaged device we jokingly call a computer: The Apple][:-(.

Other things which bother people in AP include its menu driven "shell", its lack of I/O redirection, and the Apple's lack of interrupts. Part of AP's slowness comes from its type ahead buffer. Since the Apple's keyboard is not interrupt driven, AP must poll the keyboard between executing p-code instructions. This lack of keyboard interrupt also means that the soft break (default ctrl-@) won't alway's stop a program. There are many other little annoyances, such as the fact that swapon; in chainstuff doesn't work until another program is chained to, but they are too numerous and technical to write a general article on.

As far as micros go, I'd like to have a computer with a 68000,

a meg or so of memory, a few megs of disk space, and a
Un*x/Un*x like OS. But until then I'll keep my brain damaged
Apple, and keep running Apple Pascal :-).

The mark and release functions of Apple Pascal are straight out of
UCSD Pascal, which in turn our straight out of the P2 compiler.
They are no substitute for dispose, but are sufficient
to implement the compiler (and, indeed, are more convenient for
it than dispose). Basically, the heap is treated as a
stack (allocated from the other end of memory). A pointer is
kept to the top of the stack (e.g. next available place to allocate).
new grabs a hunk from the stack and increments the pointer. Period.
No hunting from a free block. mark saves the pointer. release
restores the pointer from the saved value. In effect, release frees
all memory allocated since the last mark. This is convenient for
freeing the symbol table in a block structured language. (I can't
remember, but I suppose the marks must stack.)

As I recall, the injured Sooner was running back named Spencer Tillman
He was injured on a third-and-short situation late in the fourth quarter
and was taken off the field in an ambulance. I never heard any further
report about his condition (but then the ABC sportscasters were too
busy trying to get me to stay tuned for the USA vs. the Irish in amateur
boxing). I hope he's O.K.

    I have written several software tools for the Apple Aztec C System,
    and in response to the recent request, I will list them. Since I
    don't have a modem, I can't easily post the sources, but I will
    type them in if you request particular ones.

        wc   (lines,words,chars)
        detab/entab   (from problems in C ref. manual)

```
more      (paging lister)
show      (make unprintable characters printable)
tail      (list first/last N lines/chars of file)
fgrep          (simple version with -nx options)
sort      (quicksort with only -r option)
dc        (in C ref manual)
fgets, stoi   (new/fixed library functions)
```

I haven't started any large projects yet, but I hope to improve the editor since the source was included in the last release. I am disappointed that things aren't packaged the same way; it took me 45 minutes to get the linker and the standard library onto the same disk as the compiler/interpreter. I don't think native compiler will fit on a single disk, but that's not a big handicap since development will normally use the interpreter.

Dave Newkirk, ihnp4!ihuxl!dcn

In response to Mr. Feldman's article, I have the following remarks:

DOS is not supposed to be a screen oriented editing system. Take a good
look at the meaning of the acronym: Disk Operating System.

The reason it is slow, is a problem with timing in the loop that loads files.
Since files can be spread out all over a disk instead of in predefined blocks,
The disk is much more space efficient.
Using the RWTS subroutine, a VERY simple assembly language proigram can be
written to load files in a time that makes most people cringe. I still don't
know why thos pholks at Apple never bothered with shaving off the cycles in
their loaders, because a few cycles can make a world of difference in access
time.
```

I think the AP assembler is a dinosaur. And that's being kind. Anyone who
has used the SC 4.0 assembler or the SC macro assembler will understand why.
Speed: The SC can assemble very large programs while printing out the
listing, in a fraction of the time the AP assembler with no screen output.
Convenience:The SC has some very nice built in features including, a good
line editor, assembly to either disk or memory. target address functions,
and an include file feature just to name a few.
As a bonus, the macro assembler can exist either as a program in RAM or as
a language if a language card is available.

I'm biased. I know it. Once I entered the realms ofassembly language,
I decided that all other languages were for nerds.
and for those of you who enjoy noise, I leave you with the following program:

```
300: DEC $00
302: BNE $309
304: BIT $C030
307: DEC $00
309: DEC $01
30B: BNE $314
30D: BIT $C030
310: LDA #$FE
312: STA $01
314: LDA #$02
316: JSR $FCA8
319: JMP $300
```

P.S. don't try this from PASCAL since you will not have access to the wonderfull
subroutines that already exist in ROM.
It only a program stuck way up in RAM to move the disk head around, load, save,

[these are non blank characters]

In response to rabbit!sdh's (What is his name?) response to my article on Apple Pascal, I have the following to say:

My main use for a micro right now is developing software which is portable. I have written business software (yuk) to deal with very large files on a hard disk in AP. For DOS to come anywhere close to AP's speed in random file access I would have to of hacked DOS up quite a bit. Maintaining the program would be lot's o' fun. AP walks the line between speed and porability. I agree that assembly running under turbo-charged DOS is faster than AP, but it really isn't very portable. I also believe that there are other OSs that are more portable than AP such as UCSD Pascal IV.1. Unfortunately IV.1 (or IV.anything for that matter) currently runs much slower than AP. As I stated in my original article, I would much rather have a 16 bit or 32 bit micro capable of running one of the larger OSs such as Un*x.

The reason that the AP assembler runs so slowly is that it was not written specially for the apple, or the 6502 for that matter. Both AP and DOS should be getting faster/better in the future as I heard/read that Apple was coming out with new versions of both. The new DOS has a new name, but it escapes me at the moment. If you look at the new DOS 3.3 Master that comes with the Apple][/e, you will see that they now have a routine that does load the language card quickly (in about 1/4 the normal DOS time).

Hacking is what makes the Apple running under DOS so much fun. I liked your little assembly routine

```
  300: DEC $00
  302: BNE $309
  304: BIT $C030
  307: DEC $00
  309: DEC $01
  30B: BNE $314
  30D: BIT $C030
  310: LDA #$FE
  312: STA $01
  314: LDA #$02
  316: JSR $FCA8
  319: JMP $300
```

though I prefer

```
  314:  LDA #$01
```

- a matter of taste. As for assembly language being the only language (that isn't for nerds), I do hope you weren't just talking about 6502 assembly. It is, after all, just barely passable as a computer's cpu :-). The only routine that you are using from ROM is the wait routine ($FCA8) which can be easily

written. For most applications, the NOTE routine supplied by AP is good enough for making sounds on the Apple's speaker.
AP can also be hacked up a bit. SYSTEM.APPLE (the p-code interpreter) just sits there, waiting to be patched.

You see, I'm not saying DOS is bad or AP is great. I am just justifying AP's existence. There are some things it does well, some things it doesn't. Using it or not depends on your application. Unfortunately I don't see an operating system that runs on the Apple that does everything well, so the choice must be made: DOS, AP, other, a combination. Arguing over which OS is better is ridiculous. You gotta list the pros, list the cons, and make your decision.

zeppo!chl   Nov 14 12:00:00 1983

Does anyone out there have any experience using ASCII Express to make your Apple talk with the UNIX system. I seem to be having difficulties in getting the terminal emulation feature working to my liking. I'm able to emulate an ADM3A; however, that is a pretty dumb terminal(works terrible in 'vi').

Maybe someone knows how to set the parameters in ASCII Express better or maybe there is a better termcap to use to make things work properly.

My whole system is as follows:

Apple II + with:
CCS 7710 serial card
Bell 212A modem
Videx 80 column card
Grappler printer card
16K memory expansion card.

Thanx,
Charlie Lang

***
*
*
I found the following bugs in AZTEC C on the Apple, but at least one of them
is probably generic.

1) printf does not support the "g" option for floating point numbers.
   It turns out that the support should be in the "format.c" file, which
   is called by printf, scanf, etc.. I checked and found that it was
   half implemented, as though someone forgot to finish it. Further
   checking showed that the reason they never finished was that the
   floating-to-ascii routine (in 6502 assembler) only takes the "f" and
   "e" formats. In any case, it is fairly simple to add "g" to "format.c"
   so that it will at least *print* the number, even if it isn't optimized.

2) ".0f" prints the decimal point, after the number. Technically I suppose
   this isn't a bug, but it is annoying.

3) WARNING! If the floating point number you are trying to print out is
   a power of ten less than the precision allows, the float-to-ascii
   routine will hang! (If you don't follow that (and I'm not sure I
   stated it accurately anyway) take the following examples:
        ".0f", .01   --> bombs
        ".1f", .001   --> bombs
        ".2f", .0001   --> bombs

...)
I couldn't follow the assembler code enough to figure out what was happening.

If anyone has any fixes to any of the above (other than kludging the "format.c" functions) I would appreciate them. I've reported the bugs to MANX, but I don't know when they will come out with a fix. Incidentally, one of my disks ceased operating suddenly (both copy and master) so I had them send me another. They had a newer version of VED on it... but it doesn't work on the][e! For some reason it takes carriage return as an illegal character! The object code is also 2 records smaller, for what thats worth. I don't know if the problem was][e specific or not.

Query: A device driver for the][e 80-column card? Someone?

Does anyone know of programs that will do file transfer
by phone or direct line between Apple II running Pascal
and a VAX/Unix system?

We already have umodem running (XMODEM for the VAX/Unix).
Please respond directly to me.

I'm almost finished with WIZ II. I'm looking for a SMALL hint from someone who has played through the entire scenario...

On the first floor, you are told by Gnilda to retreive the armor of the Knight of Diamonds and bring it to her and she will give you the staff of Lyllgamin. We have collected the KOD's helmet, armor, gauntlets, shield, and a sword named Hrathnir. Yet when we went back to level one, we were not given the staff.

MY QUESTION IS: do we have to solve the Sphinx's riddle on level 6 before we get the staff?

PLEASE DON"T TELL ME THE ANSWER TO THE RIDDLE... we want to work on that ourselves.

Also, if you've read this far, you may be interested in knowing that the WIZPLUS program that's now available can be a real character-saver! We hadn't played in about 6 mos. and our mapmaker (me) misread a map and teleported the entire crew into solid rock on the first move! WIZPLUS lets you recover from that.

Any other WIZARDRY freaks out there? Any truth to the rumor that WIZ III will be out soon?

I have posted the version of "echo.c" which I wrote for the Apple AZTEC
system to net.sources. This one does everything that System V does, adds
hex conversion, and avoids STDIO making it reusable with the 'run' command
and also much much smaller. Keep those cards and letters coming...

Posted in net.sources is an AZTEC C developed version of more.c.
The output is done with "write" instead of "putc" resulting in
output almost as fast as "cat" in the SHELL. enjoy.

Heck, I haven't even gotten the sword! And I couldnt help you
with the riddle either. I could use a hint-- where was the
sword. I have the rest of the goodies.

I too have lost characters, but simply make a backup before
I start an evening run. If I get back to the tavern, I drop
out of the game, and make another backup. If I lose the party,
simply copy the backup to the scenario. Work, but worth it. If
I had WIZPLUS, I would be too tempted to cheat in more serious ways.

I would like to hear more from others, too.

This group is now opened for discussion !

To start us off how about -

     Shall we encourage Apple-specific advertising in this group ?

     Does anybody have the extended 80 col. card in a 2e ?
          How much did it cost ?
          What can you do with it ?
          Can you use it from Applesoft basic ?

     Is there anyone from Apple out there ? (or ex-apple perhaps)

     Anyone got a version of a vi-like editor for the][family ?

     Are you using your apple as a terminal to unix ?
          With a modem ? Which one - what does it offer ?

     Shall we have a survey of the group's readers to find out
          the range of equipment and interests ?

Let's get this group off the ground !!

     Thank you for creation of this newsgroup. I for one, have
owned an Apple II Standard for about 4 years, and have a system
comprised of 64K RAM, 2 drives, UCSD Pascal, Paper Tiger printer, and

use TVs as monitors.
     I have had software published in three different magazines (remember INTERNA-MAZE?).
     I have also written software on contract, and am now working on a 3D graphics package in Pascal to display different cuts for gemstones.

WHAT ARE YOU UP TO?   HAVE QUESTIONS?   ANSWERS?

Let's get this show on the road!

QUESTION - Is IIe much/any better than II with appropriate extensions?

When I had the use of an Apple last year I used Apple Pie from Programma International extensively. It was not a bad editor considering the limitations of its I/O (lousy keyboard and 40x20 screen).

It's a screen editor. You can edit files up to about 70 chars wide and it will switch the screen for you between left and right halves. It can also support various 80-col cards. I believe it wins over vi in one important issue: when you type printing characters, it puts them in your file.

I used it for extensive assembler language editing as well as invoices and random documents -- it did well on all.

It has a lot of options on how the text gets in and out of the editor -- normal appledos text files, special fast-load format files, from a chunk of memory, to/from I/O slots, etc. It's also claimed to interface well to their text formatter, but I never needed it. I often moved text in and out of the Apple by dialing the modem and getting online, running Pie, and using the "output to slot 2" or "input from slot 2 500 lines or until you see 'foo'" features. Almost like C pipes, except you need one machine per process...

I think Programma is in the L.A. area but no longer have an easy way to find their address.

I know how to write hi-res games for the Apple. I have been playing around with the 6502 for a few years now. I am looking for a few original ideas for games. That would lend themselves to the Apples graphics and control capabilities. If anyone can think of any send them to me please!!! If it turns out that it makes money I will give you part of the royalies.

Any one who want to know how to control the Apples hi-res screen via the 6502 should send me mail with a specific question and I will do my best to answer it.

Subject: Selling Software

X-Google-Info: Converted from the original B-News header
Posted: Mon Feb 14 13:41:18 1983
Received: Fri Feb 18 07:26:52 1983

I am writing in response to a note requesting information about selling independently developed software in the current personal computer marketplace. Having developed and sold two products ("Wizardry" and "Knight of Diamonds"), I have the following suggestions to individuals wishing to market software.

Today's recreational software for the Apple, Atari, and IBM PC computers is a two-tiered market. Most authors usually license a software "manufacturer" exclusive distribution rights for a particular program, computer, and medium. The manufacturer duplicates, packages, and advertises the product, paying the author a royalty (usually between 10-25% of manufacturer's gross). The manufacturer sells most software to the large distributors (such as SOFTSEL, Micro D, Eastern, and the like) who sell to the software dealers.

Although some authors, such as (Raster Blaster) Bill Budge have been successful in manufacturing their own software, it is a full-time occupation and not a pleasant one for potential authors. (whose time is better spent coding than copying disks) Furthermore, even big names like (Snack Attack) Dan Illowski and (Ultima II) Richard Garriot are finding it hard to break in at this late date. Distributors are particularly hard on these new companies, having obtained a stranglehold on the distribution networks. (SOFTSEL being the most effective at this)

Thus, I would recommend that new authors look to the larger, already established companies to manufacture their software. Companies such as Sir-Tech, Sierra On-Line, and Sirius Software have earned good reputations in the industry for being reliable and prompt with royalty payments. They are also far better equipped in getting products on the market quickly than individuals.

I would recommend that the prospective author write each of these companies and others (see the advertiser's index in Softalk, Softline, Byte, Creative Computing, etc for names and addresses) and ask for a non-disclosure agreement and standard contract. Compare these and don't be afraid to try to negotiate better terms. Be sure to retain residual rights for things such as translations to new machines, cable distribution, new media, and so forth. Make certain the royalty is not based on "profit", "net income", or the like. Don't be afraid to shop around, it will substantially improve the royalty offered. If a company wants your software in this competitive market (and its getting VERY competitive) they will usually be flexible for a few points of royalties. There most certainly is no standard rates yet in this young market.

But be CERTAIN to obtain that non-disclosure before sending a disk! There has already been some litigation in this industry for companies offing with evaluation products....

Good Luck,
Andrew Greenberg

I, for one, am really glad the Apple finally has it's own news group.

I would like to solicit comments from Apple users about the "generic"
brand disk drives that are currently being advertised. The ad usually
reads "totally Apple compatible", and the price is outrageously low,
but no brand is ever seen in the ad. Has anyone taken the gamble?
We would like to hear from you...

The second area of solicitation is 80-column boards. The BYTE review
of last year seems out of date already. Which board has 80 column, upper/
lower case, and works with Apple software (in particular, Pascal), and
is a reasonably good buy? On the flip side of that, which boards turned
out to be lemons. That might provoke a few responses...

Subject: Apple Assemblers?
X-Google-Info: Converted from the original B-News header
Posted: Fri Feb 18 07:37:46 1983
Received: Sun Feb 20 05:25:07 1983

What experience have people had with the editor/assemblers available?
I have been using the DOS Toolkit assembler which is small and neat
but slow and limited. At 1000 lines of source, te editor requires
50 seconds to load or save, and 3.5 minutes to assemble. FID loads
the same file in 4 seconds. There must be something better.

Thanks,
Dave Freeman

Subject: tax preparation packages
X-Google-Info: Converted from the original B-News header
Posted: Thu Feb 17 13:11:20 1983
Received: Tue Feb 22 06:49:40 1983

I am looking for comments anyone has on various tax preparation packages
for the Apple. I have an Apple //e with an 80 column screen and am about
to buy a printer (probably Epson MX80 or Okidata Microline 82). I know of
the existence of the following packages. Any comments? Advise?

Tax Preparer Howardsoftft $150
the oldest one I know of, looks OK to me so far

Tax Break Proforma Sortware $130
formerly put out by Datamost under the name "Tax Beater"
Ads seem a bit full of hype to me, but may be good

Tax Templates Omega Microware $90
Visicalc templates for tax preparation
Omega is the company that puts out Locksmith
(no flames from software authors, please)

Tax Advantage Continental Software $60
Continental puts out The Home Accountant, from what
I hear the best inexpensive home accounting system
Price seems pretty low, though, and they say they handle
"most common tax forms." I'm not going to do
anything weirder than income average and also
declare my wife a self employed professional
(musician), but am a bit concerned about
it handling only the *very* common forms.

Any comments would be appreciated. I would like to get *something* within
a week or so, or can the idea and do it by hand (then why did I just buy
that machine???).

Thanks,
Mark H. Mortensen

I bought a Fourth Dimension Apple-compatible drive for $300
a few months ago, and it is very nice. It's quieter and built
as well if not better than the Apple drive. I was also leery
of buying a no-name drive for a few dollars less.

I don't have an 80 column card yet, but I am going to get one
soon. I was going to buy the Vista-vision 80, but I may go
for the Videx instead, because everybody seems to have drivers
for the Videx in their software packages.

i recently bought a disk drive for $225
from star logic inc in california. it is a sugart drave and i have had no major
problems with it, except for possibly a problem with head alignment which may
just be normal wear and tear. several
people in my department have also bought this drive and the only problem i habe
heard is that one person has a copy of
krell logo that will not consistently

boot. this could be a squirely disc or
it might be a function of their fancy
copy protection scheme.

we did have problems with a generic disc controler card which apparently was not
compatible with the

ii +.

> I don't like the standard Pascal editor because it is line-
> oriented and has strong modes (either commands or text).
> I disliked it so much that I wrote a subset of the Rand
> Editor in Pascal. This editor is truly screen-oriented, and

can intermix text and commands.

I especially have trouble remembering to end the insertions with ctrl-C because I use vi on a UNIX system at work. As you may know, vi ends insertions with escape - and this has a different effect on the Apple (the text disappears!).

I won't be satisfied until I can use the Rand Editor at work and at home. I am currently evaluating a C compiler for the Apple that will allow a more powerful editor than the one I wrote in Pascal. I also heard that the Apple Pie editor is similar to the Rand Editor. If anyone is using Apple Pie, please contact me.

Happy editing,

Dave Newkirk

THE GREAT APPLE SURVEY

Having formed the Apple net group I now propose a survey of the inhabitants. I have written out a list of questions which should be regarded as a guideline, don't just answer yes/no, expand away to your hearts content.

When all the results have been gathered I will form a summary and post it to the group. The intention is to stimulate discussion by introducing us all to each other. I expect most of the answers will refer to the Apple][but others are welcome, I will summarise for other machines if enough replies come in.

Name and address will be kept strictly private unless you actually state that you don't object to it's distribution to other interested survey respondents. If you don't reply to the survey I will not send you a copy of the full replies - so there !!

The closing date for the survey will be April 1st and I will post a list of the names of people whose replies I receive each week until then. If you don't see your name, try again or use the U.S. mail if you really care (and you should !!).

Warning: This questionnaire is pretty extensive (38 questions) - please answer as much as you can find time for, it will hopefully help us avoid fruitless articles like

    Has anyone used the ...

and make it easier to find that information when we want it.
After the survey is over I would be willing to act as a pointer to people with questions like that if anyone is interested.

PERSONAL INFORMATION

Name :
City & state :
USENET address :

Do you object to re-distribution of personal information ?
    (a null answer is taken as yes)

APPLE INFORMATION

These questions are intended to get a feel for the general environment in which the apple is used. If they are not appropriate to your environment please modify the questions or answers to fit you.

What model of apple do you own (use if you don't own it) ?

How long have you owned it ?

What kind of monitor do you have ?
        disc drive(s) ?
        cassette recorder ?
        printer ?

What initial configuration did you buy ?

What other hardware have you bought (80-col, Z-card, modem etc.) ?
                    (make comments if you wish)

What hardware do you intend to buy in the near future ?

What hardware would you like to buy (must be available) ?

What hardware would you like to see made for the Apple ?

Have you made any hardware yourself (if so describe it's function) ?

Have you modified the apple hardware yourself (describe function) ?

What software have you bought (make comments on it if you wish) ?

What software do you intend to buy in the near future ?

What software would you like to buy ?

What software would you like to see written for the Apple ?

Have you used any other software on an Apple (not necessarily your own) ?

Have you ever written a sale-able product (even if not sold) ?

Describe it here if you want to.

How long do you spend using the machine in an average week ?

Do other people use your machine and for how long approx. ?

What percentage of the time you are using it is spent playing games ?

Are the games bought or home written ?

Do you have a pet project ?

Are you a member of a users group or similar ?

Do friends of yours own Apples ?

Why did you choose an Apple ?

Would you buy one again ? (perhaps a different model - specify)

If not, what PC would you buy and why ?

Do you own any other computers - how do they rate ?

What other computers do you use on a regular basis (not just personal) ?

Are you a computer professional - if so, of what kind ?

If not, how do you come to be on the net ?

What are the best features of the Apple ?

What are the bad features of the Apple ?

Have you had any maintenance problems with your equipment (specify) ?

Is there anything else ?

Mmm that looks awfully formal, trouble is I have blue eyes and blond
hair, keep thinking about empire ...

It isn't immediately clear to me that there "are more Z80 than 6502 systems
out there." But if one extends the bounds a little to include the Atari
2600 and 5200 VCS machines, the Z80 market is a magnitute smaller than the
6502 market! The 5200 might even allow for some programmability in the
future. And as far as authors of game software are concerned, I think the
6502 market is the place to be.

A new CP/M card for the APPLE][has been introduced by Advanced Logic Systems (ALS). The card provides an additional 64K bytes of memory along with a 6-MHz Z80B processor. The package includes CP/M 3.0, CBASIC and GSX-80 CP/M. I have heard that Steve Wozniak, (cofounder of Apple), has had a major hand in the design, working with Digital Research. List price, $399.

QUESTION: Has anyone had a chance to form any impressions on the new card? Is CP/M 3.0 a 'great improvement' over CP/M 2.2 ? Any comments would be of general interest.

Is there a GOOD screen editor (eg, like emacs, vi, etc) available
for the Apple II or (preferably) the Apple IIe? I am not an Apple owner
(yet), but I'm thinking about getting an Apple IIe. Please send replies to
me; I will be glad to summerize to the net

Thanks to the people who responded to tell me the Z80 board is slot-independent. I was leafing through the Owner's Manual this morning (you know, that's the book for people who have never seen a computer before) and, in the section entitled "Programming: the Ultimate Computer Skill," I came across a sentence which read "...the Z-80 card, which you install in slot 7..."

Oh well. "When all else fails, read the directions." Sorry 'bout that!

Not afraid to hang my head in shame,

John

X-Google-Info: Converted from the original B-News header
Posted: Tue Mar 8 18:43:37 1983
Received: Fri Mar 11 03:02:58 1983

I came across an embarrassing situation today while trying

to teach some people about the APPLESOFT hi-res graphic
commands. I had entered the following program:

```
 10  HGR
 20  HCOLOR=7
 30  HPLOT 0,0
 40  HCOLOR = RND(1) * 8
 50  HPLOT TO RND(1) * 279, RND(1) * 191
 60  GOTO 40
```

The program is supposed to draw several connected line segments,
each line one of the eight different possible colours. Much to
my surprise, APPLESOFT refused to change the HCOLOR, and drew
all of the lines in the same colour (white). Does anyone know
why this happened (Is there an error in my program, or does
APPLESOFT do this on purpose just to annoy people)?

Thanks,
-Ian

A friend of mine has been given the opportunity to exchange
an APPLE II+* for either an APPLE ///* or an APPLE //e*. (The //e
will include additional goodies to make up for the difference
in market value of the ///). I would like your opinions on
which is a better hobbyists machine, and why you feel this way.

Thanks,
- Ian
...!uw-beaver!ubc-vision!alberta!rob

P.S. There will be no additional charge for upgrading the computer,
and the friend already has a large collection of
APPLE II+* software.

* APPLE II+, APPLE //e, and APPLE /// are registered trade marks of
     Apple Computer Corp.

I have completed porting SOFTRANS to Bell System UNIX 5.0. This package
interfaces with the SOFTERM terminal Emulation package to allow an
Apple to exchange files with the UNIX host using a data-compressed error-
checked block-mode protocol. Also supported is the ability to route
Apple disk files into a process (eg redirect stdin on the UNIX host to
the Apple disk file) and to redirect the output from a process out to
an Apple disk file or to an Apple local printer.

The SOFTERM Terminal Emulator is available from:

     SOFTRONICS
     6626 Prince Edward Place
     Memphis, TN   38139   (901) 755-5006

who can also provide you with a copy of the SOFTRANS program that runs
on UNIX to interface with the SOFTERM package.

I've had a chance to use both the Apple IIe and the Apple III.
Given the choice between the two of them I'd stay with the the IIe.

All your Apple II software will run, your peripherals will still
work and the 80 column option at $100 isn't bad at all.

Even though Apple has re-released the III after fixing a few bugs
and in fact it isn't too bad a machine, you will have to start from
scratch with compatible software and hardware.

Apple foolishly changed their bus structure between models so all
those millions of disk,tape,printer and modem controllers available
for the II won't work in the III. Software is *becoming* available
for the III but has not reached the scale of what is available for
the II(e).

As far as I can tell, the only limitation on the IIe is that the 80
column option isn't fast enough to work at 1200 baud if you use the
computer as a terminal. You would have to use an add on 80 column
board (such as the videx) if you wanted a fast, full display.

I too have wondered why anyone would buy an Apple just to make it
into a CP/M machine. More food for thought: I heard from someone
who bought a 6809 CPU card to plug in his Apple, presumably same slot
as the Z80 would go. He did this to speed up his Pascal,
which he says it did by a factor of 2 to 4!
     Now, the 6809 has a well-established OS called FLEX
which is about the same level of power as CP/M but more user-friendly
and neatly done. Quite a bit of applications and language software
is available for it.
     Then there is about to be OS-9, whcih is almost UN*X.
Ponder: If you want to replace your 6502 with another 8-bit micro,
why not use the latest and greatest? FLEX has been implemented
well on the Color Computer, so it ought to be easy to tailor
to Apples.
     Yeah, I know, there isn't the applications software base
in FLEX (or anything else) that CP/M has. Jeez, how long
is downward compatibility gonna enslave us?

     I have received a few requests for additional info about
     the Zork Users Group, so I will expand a bit on my last letter.

     The Zork Users Group is shutting down operations after July 31.
     Orders received after that date will be forwarded to Infocom,
     which will carry everything ZUG has except: buttons, T-shirt
     transfers, bumper stickers & Zork I poster. This leaves only
     the InvisiClues, maps, the games themselves, and the new Zork

II poster. If you want to be sure of getting something, send your order soon to:

Zork Users Group
P.O. Box 20923
Milwaukee, Wisconsin 53220-0923

The prices are:

InvisiClues (for Zork I, II & III, Deadline, Starcross)
$9.95
Guide Maps (for above games, in nice artwork)
2.95
Zork logo T-shirt transfer (as seen on Zork box in stores)
3.95
Zork bumper sticker (I Love Zork, (with a heart))
.95
Zork buttons 1.25 (all six for 6.00)
I Love Zork,
Zorkers Do It Under the Rug
HELLO SAILOR nothing happens here
I'd Rather be Zorking
I'm a Zork Groupie
Master Adventurer
Zork I map 5.95 (color artwork of landmarks in the game)
Zork II map 6.95 (B&W drawing of all rooms with occupants)

In addition, you can order any of the Infocom games at list price. For most micro systems (Apple, Atari, IBM, TI, C64, TRS-80, NEC) the prices are $39.95 for Zork I, II, III, and Starcross, and 49.95 for Deadline, Suspended and Witness. The prices are 10.00 more for CP/M and the PDP-11 versions.

Happy Zorking,

Dave Newkirk

Lines: 48

I for one am a little disappointed in the Apple //e as compared to the Apple][. There seems to be a significant problem with the //e's screen I/O when using communications software/hardware. For example, I tried using Datalink (a Pascal based communications program) with the Apple //e 80 column card, and it loses characters at 1200 baud. Not all the time mind you, just when the screen is filled and has to scroll up one line before the next line can be displayed. If I take out the 80 column card, the problem persists. Not only does the problem exist with the Apple 80 column cards (both the plain and 'extended' with 64K RAM), but the Smarterm II suffers the same fate. The Smarterm I appears to work fine however with Datalink, as well as the Wesper Systems 'Wizard 80' card.

The problem crosses software boundaries too. Ascii Express (An Apple DOS based communications program) seems to have the same trouble, with the afore mentioned 80 column cards, as well as a Pascal based communications program of my own construction (which works fine on my Apple][as well as a Franlin ACE 1000).

Visiterm, however, which uses its own character set seems to work fine. Softerm, a terminal emulation program also seems to work fine. It's quite clear that Softerm uses it's own screen I/O instead of 'hooks' into the monitor because it works at 9600 baud. (Nice package, by the way).

Thus I conclude that there is a hardware design error with the Apple and ALS 80 column cards. There is a close connection between Apple and ALS. Perhaps it is too close?

I know that apple was aware of a 'bus contention' problem between the new 'slot 3' and the rest of the bus, but I haven't heard of any fixes in the mill.

Has anybody else experienced the symptoms I describe? They are probably more apparent when communicating with full duplex character-oriented services like UNIX than with line oriented (which have a short delay after sending a line) services like IBM TSO. Does Apple plan to fix the problem?

Why not take this a step farther and ask "Why Cp/m"? Why are there
still billyuns and billyuns of people out there who insist it is an
operating system? For god's sake, why does everybody want to keep the
z80 around for another umpteen years?

Don't give me that garbage that it would be too costly to upgrade a
business to a 16-bit system, for the new system running a real OS (read
Unix) would pay for itself quite quickly in being far faster and more
usable.

How many people out there actually realize what the origins of cp/m are?

          Watching micros and their users getting left in the dust,

The problem with losing characters when scrolling is indeed a problem when using the built-in scrolling functions and certain software/hardware combinations. The problem has to do with the time it takes to scroll the 1920 characters in memory (Apple-//e 80 col card). Some of the 80-col cards for the][(which I should add cost a lot more too) use a CRTC chip which uses an array of pointers to the lines on the screen, e.g. to scroll the screen, all the program has to do is move all of the pointers up by one and clear out an 80-byte memory area for the new line. This is obviously much faster than moving 1920 bytes.

SOFTERM has no magic trick for scrolling the screen faster, in fact it scrolls slower. What it does do however is never work on the scrolling job long enough to lose a character at 9600 baud, assuming that the modem or serial interface can buffer 1 character. That is, by using instruction timings, you can figure out about how many instructions you can execute in 1/960th second and you never do more than that without checking to see if a character came in. Since the Apple is not interrupt driven from the factory, this is the only way to do it. The characters which are brought in during the scroll operation are buffered (SOFTERM uses 256 byte buffer) and then processed when the operation is completed.

My apologies to all of you for the incorrect termcap posted here a few weeks ago. It was my original scratch version which refused to work with vi. Herein you will find the corrected, updated version.

For those of you with either Programma's Pie or Hayden's Pie, I'm including a patch for DOS which allows them to function interactively as a terminal, with data transfer.

```
#The following termcap entry works only with an Apple ][+ that is
# equipped with a Videx 80 collumn card in slot 3. A special routine
# must be installed at the apple end to enable scroll down, here
# indicated with a ^U. The Videx card must have inverse char set.
qa|apple|apple-v80|Apple][+ w/Videx80 & custom scroll down:co#80:li#24:\
        :bs:ae=^z2:as=^z3:cm=6\015\036%r%+ %+ :\
        :ce=6\035:ho=50\031:so=^z3:se=^z2:nd=\034:\
        :do=\012:up=\037:cl=40*\014:dB=10:xn:am:dF=50:sr=\020:cd=20*\013:
```

Pieterm is written using Lisa 2.5. If any of the opcodes used are confusing, refer to hex values in the left most collumn.

```

I'd like to know what functions are performed by the 6522 chip.
I assume it is a PIA, with two 8-bit bi-directional (programmable0
parallel ports. But what else does it have? Interrupts, timer,
or what? The 6530 chip used in KIM-I had all that plus ROM and
a little RAM. Are there any manufacturer's spec sheets for
this and other 6502 family parts, or do I need to borrow a
Commodore or Apple manual?
     Thanks, mike k

To: Dave Selkowitz Tektronix Wilsonville, OR
Subject: Apple Terminal Emulation Programs

I have not used ASCII Express but SOFTERM gets my vote. (I take it for
granted that anyone using an Apple II as a terminal to UNIX will have a
good 80-column card and a good lower case adapter.)

When I got SOFTERM I had just obtained a Microbuffer II-S from Practical
Peripherals; the printer would not work with any of the SOFTERM printer
drivers (they did not have one specifically for the Microbuffer, either
serial or parallel). I phoned Softronics and upon explaining my problem
the man gave me the name of one of their programmers. I called him. He
said he hadn't seen the Microbuffer yet - could I send him a copy of the
specs to see if he could produce a driver for it. I did and in a couple
of days he called me back. He thanked me for sending the specs, said the
driver was ready, and asked if I'd like to get it now over the phone.

Sure, I said, but I haven't tried the file transfer functions on SOFTERM yet. No problem. He told me exactly how to set the parameters then told me to hang up and connect the phone to the Apple. I did and in another 10 minutes had the file on my configuration disk. It worked fine.

I use SOFTERM with an Apple II with Videoterm and Videx Keyboard Enhancer to dial up UNIX. I have tried the emulations for adm-3a, adm-5, vt-100, vt-52, Televideo 910 and (the most useful of the lot) Televideo 925. (My Videoterm doesn't have inverse but that doesn't cause me any problems.)

The manual is extremely complete, has an extensive and useful index, and is relatively easy to use. If anything, this program is over-documented. Every section has all the information needed, resulting in repetition and a real THICK book. The configurations include drivers for MANY 80-column cards (including Apple IIe), printer drivers, modems, etc.

Two possible disadvantages to SOFTERM. First, the program disk is copy-protected. There is a copy on the reverse side for backup, but I don't think this is a suitable backup scheme. (The new version is supposed to be unprotected.) Second, many things you may need to do fairly often require multiple keystrokes. E.G., to toggle the printer on/off you do ctrl-v p and to send a BREAK you do ctrl-v b. To send a control character you have to do ctrl-c then the letter key. It can be a pain to do anything that requires control characters, such as trying to do full-screen editing on a VMS system while emulating a vt-100.

In summary, SOFTERM is an outstanding Apple II program in every way, the company has provided extraordinary support, and the new version (unless Softronics' reach exceeds their grasp, as so often happens in this game) should be even better.

I'd like to hear from anyone who tried my el-cheapo (two resistors,
two transistors) circuit to feed an Atari-type stick into an analog
joystick port (CoCo, Apple, Vectrex, etc). Posted it about a month ago
after a dozen requests. Did it work? Mine does.
     I got one cryptic mail response cussing me out for posting
an "open-ended article." He/she/it didn't say what article, newsgroup,
or what! Did my stick converter posting get garbled in some far corner
of the country?

I picked up a flyer from Micropro (Wordstar) at the last NCC which
proposes a seemingly attractive offer for Apple II owners.

If you buy Wordstar (or Infostar) before August 31, then they will
give you FREE:
       "6 Mhz Z-80B Processor
     64K RAM Memory on the board
     CP/M 2.2 Operating System
     2k EPROM on the board
     70 Column high-resolution capability (separate 80-column board
        not needed)
     Shift Modification Device for upper and lower case
     Expansion Interface Port for extra memory, parallel or serial

board, or networking
Communicates with Apple through parallel port
40-255 column horizontal scroll capability
Supports popular Apple peripherals including 80 column boards,
floppy and hard disk drives, and printers"

This sounds almost too good to be true. Has anyone had any experience with this offer, or have any knowledge further than that on the flyer? In particular, I would be interested to know if the 70 Column card would be compatible with software intended for the Videx 80 column card.

I have a bitpad which I use to create image files on an apple.
I'd like to be able to use the images I create on a PC as well.
Does anyone know of a program which lets an IBM read an Apple disk
or an Apple write an IBM disk?

Thanks,
Ben Cutler

Concerning the games "Cannonball Blitz" and "Zaxxon" for the Apple:

Does anyone familiar with "Cannonball Blitz" know how
to get to the flag on the third screen? I can easily get to the upper right
hand corner of the screen, but can't get past the oncoming cannonballs to
reach the flag on the left.

Has anyone had the opportunity to compare the Apple version of Zaxxon
with the arcade version? If you have, I'd appreciate hearing your comments.
I have seen the Atari version of Zaxxon and was disappointed
in the lack of smoothness and responsiveness in steering the plane.

Thanks.

I saw at CP/M-83 in San Francisco an Apple card that
plugs into the IBM-PC that allows the PC to run all
of the Apple software. (Like the Baby Blue for Z80
CP/M) The card was on display at the Lifeboat booth
(212) 860-0300.

  Does anyone out there know what terminal emmulator can I use
with the following hardware configuration:
     computer : Apple //e
  interface card : MBI's VIP card , CCS 7710 compatible
           modem : Hays Smartmodem 1200
  Right now I can use them all togeher sice the VIP card has an on
board dumb terminal emmulator. But the problem is that I can not use
the 80 column card at the same time.
  Anyone who can help me, please send me mail at :

         seismo!rlgvax!cvl!nk

Subject: Has anyone heard of DBMS' for Apple ?

I know it sounds funny, but I have seen them in the Apple "Blue Book"
and I would like some more information. The systems I saw had similar
capabilities, such as allowing "unsophisticated" users to design a
screen layout, and then automatically setting up files, along with
allowing design of reports, etc.

I'm interested in systems using SUPERKRAM or some similar Btree
indexing utility, all in BASIC (sorry, that's all their Apple II+ has),
mapping into (but not necessarily) a relational database, and
requiring no more than two disk drives. I'd like to hear about:

    CONQUEST
    REQUEST

or any others you have heard about. I'd like prices, if you have them,
but I'm most concerned about how reliable they are, performance, gripes
you have if you've used them, etc. Any suggestions are welcome;
I'm developing a very small, simple database, but want to save myself
some time. I also want my customer to be able to modify it or to
add applications of his/her own. Speed and space considerations are not
yet important, but may become that way in the future (don't they
always?).

Please respond by e-mail or to net.micro.appl as soon as you can. Thanks.

I am looking for any information about how the apple uses a modem. What
special subroutines are used and how the data is loaded serial or parallel.
I would appreciate hearing from those of you with this information.

Quadram QUADLINK

The Quadram QUADLINK (QL) board is a $680 card for your IBM Personal Computer or XT that allows you to EMULATE an Apple][+ computer. I have one of these cards in my XT and submit the following report from my own experience.

Initial installation of the QL is not for the computer squeemish. It requires total disassembly of your machine to get installed. Basically, several of your computer's functions are re-routed through the QL. These function are:

* Disk Drive Access
* Monitor Output
* Speaker Output

After installation, you have placed jumpers between your Disk Controller, Monitor, and speaker to the QL board.

Operation is simple, you are supplied with an IBM DOS 1.1 program called QUADLINK.EXE that you start up, this program asks you to insert a disk called "FILER" that is supplied with the QL package. The QUADLINK program then reads FPBASIC and DOS 3.3 from the "FILER" disk into the memory on the QUADLINK card. Once Loaded, it tells you to type CTRL-ALT-DEL to boot an Apple Disk in drive A:. You insert your Apple Disk in Drive A: and away it goes.

So far, the only noticeable difference between operation with the QL and operation on an Apple][+ is that disk access is slower. I haven't compiled a percentage figure but I'd guess on the neighborhood of 20% slower than Apple Disk Drives.

Once loaded, QL emulates the following:

* One Apple][+ 48k with Language Card (for 64k total)

* Two Apple Disk][disk drives (in slot #6, if you have
two IBM Disk drive, I have an XT
so I can only have 1 drive)

* Printer in slot #1 (only if you have a parallel printer
on LPT1: on your PC)

* 40 Column text display

* LORES Graphics

* HIRES Graphics

* Game paddle connection (a socket just like the Apple's
is on the QL ready to accept
an Apple Joystick.)

Since the QUADLINK.EXE program reads a copy of Apple's FPBASIC into the memory on the QL, you have an exact duplicate of the APPLE ROMS in the machine. Therefore, the only programs that won't run are those that require other hardware (such as modems, 80 column cards, etc.) and programs that are extreamly protected.

So far, I have been successful at running: UCSD P-system, Fortran, DB Master, Applewriter][, Visicalc, PFS: File, PFS: Report, all DOS 3.3 programs.

So far, I haven't found any of my software that won't run because of protection. A few won't run because it requires a Micromodem or a Videx 80 column card.

It doesn't matter what other hardware you have in your PC (such as serial boards, etc..) the QL will not allow you to access them in Apple Emulation.

Also, the 64k that is on the QL is for the Emulation mode only. This memory is not accessable by your PC if you're not using the card. Likewise, when in Apple Emulation mode, you can't access any of the other IBM PC memory.

The only feature of the QL that is available from IBM Mode is the game paddle connection. Paddles connected to this port can be accessed just like the IBM's Game Controller Adapter Card.

I hope that this helps some of you out... If you have any further questions, feel free to drop me a line.

I just purchased a new Apple IIe. I have had a vanilla Apple II for
a couple of years now and have recently added a generic Z80 card
to add flexibility to my system.
My IIe has an 80 column extended card, a Super Serial Card,
2 disks and a printer interface.
(Besides the Z80 card)>
When I purchased the IIe, the dealer said that their were problems with
the IIe and the Z80 cards. He didn't elaborate on the kinds of
problems, but he said that the card may not work in the IIe.
He indicated that some cards worked on some IIe's, however.

I noticed that (particularly) when I am in 80 col mode (cp/m or Apple
DOS), I occasionally get garbage characters (or perhaps just dots or
groups of 4 dots in a square) that appear on the screen. They don't
seem to do any interferring with my program execution, but they
are annoying (esp. when I am using it in terminal emulation).

I ran a quick test this morning, and I found that I can get the
garbage by looping on the catalog cmd in 80 col mode (just once in a while
a char pops up).
I removed the Z80 card and for the next 3 or 4 minutes there were none.
Upon replacing the Z80 card, they again appeared.

I will continue testing, but I wonder if anyone out there has had
similar experiences and/or know of any fixes?

I will post a summary to net.apple if there is sufficient response.

I am currently investigating a replacement keyboard for my
Apple][. Not only has my current keyboard worn out (several keys either
repeat undesirably, or do not function regularly.), but I would also like
to have a full ASCII keyboard (with upper/lower case, and all those nifty
characters not on a standard Apple][keyboard.)

The best solution I have found so far is to buy an Apple IIe keyboard and wire up the matrix myself. The Apple IIe uses GI's general purpose keyboard encoder and a 2716 to provide for shift, caps lock, etc.

I would appreciate any help from persons who have experience or opinions on the subject. Most importantly, where do I find a keyboard that doesn't have too many more keys than the Apple][keyboard, so I don't have to hack the case too much.

Thanx,

Ted Estes

Could anyone with experience with any of the fast Apple DOS's give me some information for a comparison. Please reply by mail and I will summarize the results to the net.

Data which will prove useful would be:

1) Any added commands
2) Increase in size (if any) of the DOS
3) Does it use the language card?
4) Does it recognize ROM cards in other slots?
5) Cost
6) General comments. (For example, I know that Diversi-DOS uses error numbers in stead of messages to save space in the binary.)

Thanx in advance.

The last I heard, Apple had abandoned plans for a portable system and were pinning their hopes on the McIntosh. This has been some time ago, tho.

Say, what ever happened to the macintosh anyway? It was supposed at one time to be introduced last spring. Now it is nearly autumn and still no macintosh. I don't even read about it in the industry rags anymore.

Well apple, what happened?

Why is it that the Apple computer is so popular?
What can it do besides run games?
Is it anything more than an expensive
desktop calculator (in reference to the spreadsheet
programs)?
Do small businesses actually use Apple computers
for anything useful? How far can you push an
Apple before it runs out of gas. (not very far,
I would guess) How does Apple's OS compare to
CP/M?

I am not an apple user but peruse net.apple because sometimes there is something of value to me. I own an atari 800 and I'm fairly abreast of applications that micros are used for.

  I know for a fact that a california based architect uses apples as a means of producing layouts (drawings). The apple is the core of this computer aided design system! The drawings are created on the apples and then printed out on a big drum plotter. Actually pretty impressive.
I know also that more than a few companies use apples for computer-aided design purposes. Among them: an aircraft manufacturer, architects, engineers,...

  I know also that a pretty high number of small businesses are currently using the Apple (Atari - less so , I've only heard of two or three) as the basis for doing their inventory. The kite store my wife managed for a couple of years did their books with an apple and kept track of their inventory in the same way.

  My brother-in-law's father is using an apple to keep track of his drug store's inventory.

I really believe that *alot* of small businesses use apples.

As to the question of how far can you push an apple...i don't know.
I know that in the cases I've cited the apple has performed reliably and once the people(who before this had never touched a computer) became familiar with the machines, the question of what OS the machine used probably was of little concern to them. Most people running small and some not-so-small businesses don't need the power of a CYBER.

This subject is an interesting one to me...i wonder how many other things are done on apples[or ataris or 64s or franklins]?

A friend of mine asked me to find out what a good
word processor for the Apple II would be. Apparently
he has tried apple-writer and word-star and was not
satisfied with either. He wanted to be able to do
underlining on the screen. ie have characters actually
underlined on the screen, so that what you see on the
screen is what you get on the printer. Any suggestions?

I am looking to this net for help. After my wife started her own business
it became obvious that record keeping was going to present a problem. Our
account an individual from the dark ages of vacume tubes and punch cards
asked my wife to go out and spend 90 dollars on some record keeping
books. I have looked at the books requested and I cant believe it!
An office supply store can get 90 dollars for 2 bulky books that require
a fine hand and very small print as well as no editing ability!
 It seems to me that I would be able to use my apple for this ledger
routine. I would like to hear from those of you who could recomend software
packages that perform the functions needed for a small business.

I have often wondered why the Apple caught on and held so well.
Don't own one, but I suspect the reasons are:
1) Expandability--the mother board construction costs a lot but
lets you add things relatively cheap. A lot of little companies
make music synthesizers and etc etc to plug in here.
More important, you can plug in a Z80 or 6809 board and run a REAL
operating system.

2) Marketing: the Apple was plugged right from the start as a
useful business machine, ALSO a serious scientific/technical calculator
with all those hi-res color graphics, AND of course those graphics and
joysticks could be used after-hours for fun-and-you-know-what.
Consequently several sectors of the user population went after Apples.
Compare this to Radio SShack's unfortunate marketing of the Coco
as a game-player that might also balance your check book and let you
learn BASIC.

3) Third-party hardware (aluded to above) and software support,
ABETTED and ENCOURAGED by Apple, Inc. I'll bet less than 10% of
the software running on Apples is from Apple. (Here's another area
where Radio Shack blew it, till recently).

As far as the Apple's intrinsic merits, I'm amazed that anyone today
would pay $1500 bucks for that vintage '77 hardware and Apple-DOS.
Amazed, until i remember the vast bulk of item (3) above.

In fact, (3) helps me understand why anyone would deliberately program
a Z80 or use CP/M ... mike k

I should add that in '77, the Apple was good value for the money
(about $1000-1500, someone correct me please). Some non-hacker
who wanted a plug-in & go system could pay $600 for a PET with lousy
keyboard, or about the same for the first TRS-80. Neither of these
had what I'd call graphics, color, nor analog joysticks. And the

Apple looked better and more solid, all in one piece.
It wasn't till 1980 that AAtari and the TRS Coco appeared to give Apple
any competition in the color graphics arena. By that time,
third-party hard & software had pretty well nailed down the Apple's place.
That kept the Apple selling even after cost-efffective technology had
passed it by. (The 1980 Colro COmputer at $400 had almost identical
functional specs to an Apple, using dynamic RAM and a better microprocessor.
The Atari 800 was better in most respects, tho for $900).
     mike k
PS: Has anyone seen a really comprehensive history of home computers?
Sounds like we have the makings of it on this net!

A while ago I posted a request for information about installing a full ASCII keyboard on my Apple II+. I received a few suggestions, got a few requests on what I found, and did some research of my own.

...tekid!dennisw suggested looking at the keyboards advertised in Byte by various vendors. These ads have keyboards ranging in price from $80 to $100. The descriptions for the above say something like "Apple II compatable" or "ASCII keyboard for Apple II", etc. They do not say how many keys are on the keyboard, or if one can get {}[]\|~` with the keyboard, or if one has to hack at the case to accommodate extra keys (which one would assume are necessary to get a full ASCII set). I was therefore very skeptical. If anyone has bought one of these, and found it to offer a FULL ascii set, let me know via netmail.

...tekecs!davids sent a nice summary of various options for those desiring a new keyboard. These options included 1) replace keyboard with one of those separate, detached units, 2) buy and ascii keyboard and build into the Apple case, and 3) install Videx Keyboard Enhancer and Funtion Strip. Dave disliked the detached units because the $300 price tag did not buy one many extra options. I don't like them because I already have a computer, monitor, 2 disk drives, printer, paddles, joystick, modem, etc., taking up room on my computer stand, and cannot spare the extra space needed for a detached keyboard.

Dave recommended the Videx Keyboard Enhancer. It gives the user full ascii, plus keyboard macro edit/download capability. The full ascii set is realized by control key sequences, which Dave assured me was a very workable solution to the problem. The Function Strip adds 16 user programmable keys.

I have decided, however, to go with an Apple IIe keyboard and hack it into my case. My reasons for this decision included 1) compatability with existing software, 2) esthetically pleasing, 3) usable by a novice, and 4) I was looking for a hardware project. The IIe keyboard can be purchased from an Apple dealer for about $88. Also necessary for the project are an AY-5-3600-PRO keyboard encoder from General Instruments (about $11) and a 2716 EPROM (price variable, depending upon whether or not you buy it). Find a IIe manual and copy the schematic for the keyboard encoder from it. (Note that AKD means "any key down".) I will not recommend how to get the codes to program into the 2716, but will point out that it gives you total flexibility as to where you map your codes. Also a decision needs to be made about repeating characters, as this function is provided by a custom MOS chip in the IIe. All this extra stuff needs to be stuck on a little piggy-back board. I am in the process of ordering the necessary items. When I get a working version, I will post my results, and offer a schematic of the final design.

Thanks to those who responded,

Ted Estes

First, I think that many small businesses DO use the Apple II.
Your assumption that it will run out of gas pretty quick is not
too accurate. It is slow for many jobs, but for the single user
kind of operation, this is not too noticeable. Among the "business"
kinds of things I have done on the apple:

POLLSTER- Survey preparation, data collection and analysis
program. formatted a printed form for about 50 questions,
answers multiple choice, keyword, and numerical data.
Set us analysis template at the same time as it printed out
the master form. (Paper copies given to phone team)
Collected results (with error correction) from the marked
papers.
Printed analysis of results, with confidence intervals, etc.
-- used with a school levey in the local community. about
500 respondants.

Newsletter Manager - maintained the mailing lists, subscription
information, and invoicing for technical newsletter to about
1000. produced invoices, labels, mailing labels, reminder
letters, dunning letters, etc.

Both of the above in PASCAL.

Simulations in (ugh!) Basic.
Roll replacement stategies for vertical cold mills. Simulation
for MBA project. Ditto for several traffic simulations.
Only problem with BASIC is the lack of the distributions as

an internal function. You fake them or approximate them mathematically.

Depreciation, and profit/loss on 6 apartment units. (Visicalc).

General Ledger for a small business.

And my most used program, SCREENWRITER II, a quite acceptable
word processor which has produced most of my papers for MBA,
all of my son's letters to graduate schools, maintains the
mailing lists and produces the form letters for a subcommittee
of NCTE, and handles all documentation which I want immediate
output from at home. (If I need, I carry a floppy to work
and move UNIX files to the floppy, and vice versa.)

I have not yet picked up a terminal emulation program, and
use a vt100 to get to UNIX, and to better printers, and
to do Bell Labs stuff.

Finally, I have DB Master, a fair dbm program, and the
Howardsoft Tax Preparer, which was good until last years
rework. I would have tried to make a couple of bucks before
the screwed it up, but they kludged it so badly that I wouldn't
even try to use it commercially now.
(I would be interested in hearing about others.....)

A friend of mine has an Apple-IIe on which he runs CP/M. He's testing out
some of my programs, so I'd like to help him out. It seems that whenever
CP/M does a warm start, the screen is cleared. This is a royal pain in the
neck when running things which leave information, error messages, etc. on
the screen and then terminate by calling 'SystemReset'. Is there any way
to stop the thing from doing this?

Thanks.

Someone listed the processor boards you can plug into an Apple if you
need something a 6502 can't do. He forgot to mention that you can get
a 6809 board, too (wish I could remember who markets it).
Somebody could get rich selling these and either the FLEX DOS
(like CP/M only nicer) or OS-9 (a micro-UNIX). Then the Apple
would beat out not only the IBM PC but also the Radio Shack Color COmputer
(which has a lot of shortcomings, but not in the processor & DOS dept).

This is a reply I got by mail to a question several Apple users
have asked about. Hope it helps (I don't have an Apple, ssometimes
wish I did). -- mike k

The manufacturer of the 6809 co-processor board for the Apple is
Stellation Two, in Santa Barbara. Their phone number is 805-966-1140.
I believe they offer either OS-9 for their board, although the main
aim seams to be to offer a faster p-code machine for Apple Pascal.
If you have any further questions, I would suggest that you contact
them, I found them to be very helpful when I did.

On the subject of boards to enhance the Apple, it seams to me that
the 68000 boards now offer much more performance for the dollar.
The 6809 offers a 20% speed improvement for about $350. The 68000
offers at least 400-600% improvement for $1500. Admittedly, the cost
is higher, but I'm not convinced that if you need better performance,
the 6809 is the cost effective way to go. I know I am considering
a 68000 for my Apple.

I used a Hayes Micromodem-II from 1978 until about 6 months ago with absolutely
no problems. Almost all of the software you would need is already on the board
unless you want to something esoteric like emulate a VT100 or do print-online.

I now use a Hayes Smartmodem 1200 working through a Mountain Computer CPS Multi-Function card (Clock, Parallel, Serial). I use SOFTERM to emulate a VT102 (a package which I highly recommend). I am now Beta-Testing a new release of SOFTERM called SOFTERM-2 which I hope to post a complete review of within the week.

Another good question to ask is what is a good serial card to use with your modem if you get a standalone modem. The CPS card works fine for me, but requires a piggy-back chip on the Apple-II. I don't know if it will work on a //e. The old Apple serial card won't work for communications at all, the old communications card did have a UART chip but was still shakey. I've heard that the new Apple Super Serial card is good and the ALS serial card is crummy. Beyond that, ask the NET.

Why does anyone own an Apple you ask?

Well my Apple

1. Has a keyboard with its own uP which produces all possible ASCII characters, allows each key to be redefined to produce any of 8 different macros per key (redefinition via keyboard or disk file), has both slow and fast auto-repeat capability, and includes 16 macro-redefinable function keys to name only a few of its keyboard features. (Videx) Does your PC?

2. Has an excellent 80 column display (I believe it to be far better than my IBM monochrome display at work. An optional 128, 132, or even 160 columns by up to 48 row display is very inexpensively available. (Also Videx) Does your PC?

3. Currently has 144K of RAM and can be expanded practically indefinitely.

I am about to add a 294K disk emulator board. Does your PC have this capability?

4. Has both a 6502 uP which runs the largest selection of software for any PC known, and a 6Mhz Z80B which is running CPM PLUS (3.0) which provides such useful features as I/O redirection, path searches, banked memory management, and much, much more. In addition a super fast 3.6 MHZ 6502 uP is available if desired, several 8088 boards, and several 68000 boards. In short it provides all the expandibility of an S100 system, with the advantage of OEM focus on a specific machine. Of course a huge selection of other options boards are available including memory boards, solid state disks, RGB boards, I/O boards, speech processors (input and output), and on and on and on. Does your PC have all this?

5. Disk drives and controller boards are readily available with software support for single density (143K), double density, and double sided double density 5 1/4 floppies, as well as 8 inch floppies, and hard disks. Other storage systems are also available including 9 track tape drives! By virtue of both Apple Dos and CP/M no other PC even comes in a close second in terms of Software available for all these disks. How about your PC?

I could continue to go on but what's the point? Oh yes, do Apples really run games? I didn't know that!!
My question to you -

Why are you so uninformed?

Looking for the following:

1) A "C" source code debugger that will allow developers to debug
both native-compiled, and cross-compiled code at the source level.

2) A production quality 6502 C cross compiler that will run under
either VMS or Berkeley Unix 4.1 on a VAX.

Thanks for your assistance, please mail replies via Usenet or U.S. Mail:

I have a zx81 (timex) microcmputer with some peripherals,
including the timex 32-column thermal printer.

I recently acquired an apple II+ with one disk drive, and am
interested in using the timex printer (temporarily) for hard copy
from the apple.

If you have done this, or tried, or thought about doing it,
please help me.

thanks

     This is in response to several requests for information
about Softdisk Magazette (also 'cause I think it's great).

     Softdisk is one of several Disk Magazines to come out
recently and I think it's one of the best bargains around. The
basic format is two disks of information sent monthly in a
reuseable mailer, with prepaid postage. The cost is $7.00/month
or $55.00 a year (sample copy for $10.00). When you get the first
issue you send back the empty mailer, the next month you keep the
'keeper' disk, the current issue, and send back the previous
months disk. So for each month you can keep a disk and copy a disk.

     Softdisk is completely copyable and contains a wealth of
information. On the first side of the first disk is the 'magazine'
itself - a cover graphics, editorials, tutorials on Basic
Programming, and Software reviews. Hi-res Movies, Music, Hires
adventures and other features have been included in previous issues.

     On the back side of the first disk is the 'Harvest' -

contributed software from subscribers. There have been some very sophisticated programs on this side, ranging from databases to editors, tutorials to text adventures, spread-sheets to spelling drills. All are list-able and a real learning experience to see how others do 'neat' things. If you submit a program that is published, you will get a free issue of the magazine.

The second disk is dedicated to executable advertising, usually one large self-running demo and several other smaller demos. All in all it's a real bargain.

See the current issue of Softalk for an example of a cover graphics. Their address is:

I was interested to see Dave Seaman's list of points about Apple Pascal, and felt that I had to make a comment. I think that letting the DOS remember which disk drives are associated with specific volume names is a very bad idea. If one has an application that requires switching diskettes in and out while a program is running, and if you try to do your own I/O error checking, that feature will bite you. If you start out with volumes FOO: and BAR: in the drives, remove BAR: and insert JUNK:, and then attempt to reset JUNK:temp, the system generally

says that the file wasn't found, because DOS doesn't check the diskette directory (this assumes no file BAR:temp). If one leaves JUNK: out when resetting JUNK:temp, the error indicates that the file isn't found, when it should say that the proper volume wasn't found.

Another cute thing happens when you have two volumes named FOO: which have different directories; if you start with one FOO: and then switch to the other and try a write, the first FOO:'s directory will be written over that of the second. Of course, one can argue that anyone who has two different disks with the same name deserves what he gets, but I would prefer sacrificing some speed for a more reliable scheme.

The only sure way that I have found to get around this is to always reset using the device number and then UNITREAD the directory to get the volume name. If I am missing something, I would certainly love for someone to straighten me out; if not, I would argue that this 'feature' is not one that Apple P-system users can be proud of.

   We have some folks in our School of Forestry who need to run some software developed for an Apple][+ on an S-100 system, specifically a Vector 4. Anyone know of an S-100 board giving such a machine Apple compatibility?
   While I'm at it, there's a good chance at least some of this stuff is in BASIC (I'm not sure). Anyone know of a filter program to translate Applesoft to Microsoft Basic?
   As usual, I'll summarize to the net if I get anything fascinating.

Ned Danieley has raised some interesting questions concerning the way Apple Pascal remembers volume names. The system is reasonably intelligent, but it is not foolproof. I will paraphrase:

Q. Suppose I have two volumes on line (FOO: and BAR:). While my program is running, I remove BAR: and insert JUNK:. If my program now tries to reset JUNK:TEMP, will it succeed?

A. If TEMP exists on the volume JUNK:, the system will find it. It will try all the drives, if it has to. If JUNK: is on line, but there is no file TEMP, your program (assuming it does its own checking) will get an ioresult of 10, which means "No such file on specified volume."

Q. If JUNK: is not on line, can my program correctly determine the reason for failure?

A. If the system fails to find JUNK: in any of the drives, your program will get an ioresult of 9, meaning "No device -- volume is not on line." You may then take appropriate action (such as pausing to remind the user to "Put in JUNK:").

Q. Suppose the file I want to open is BAR:TEMP, and that I have just removed BAR: and put in JUNK:. The system still has the directory for BAR: in memory. Won't this cause trouble?

A. You're right. In this case the system does not double-check. On the other hand, if you ask for #5:TEMP (assuming BAR: was last seen in drive #5), then the system does re-read the directory before proceeding. (What can I say? I have been using Apple Pascal for two years and this has never happened -- even though when I first started I had only one drive and I had to put in a new disk every 3.8 seconds.) Probably the best defensive measure is to do a unitclear on each drive before you start opening files. I now have three drives and I don't often swap disks anymore except to make backups, so I'm not particularly worried. This is the only thing resembling a serious problem that I have ever found in the system (I know of two minor bugs in addition to this). I only wish that VSOS 2.1 (the operating system for the Control Data Cyber 205) were as stable and bug-free as Apple Pascal 1.1. Incidentally, Apple has announced that version 1.2 will be available in the fourth quarter of 1983, with full support for all features of the //e, including 128K bank-switched memory and double-density graphics, as well as hard disk support.

Q. What if I put two volumes named FOO: on line with different directories?

A. The manual specifically warns against doing th. An important special case is making backups -- you put the original and the backup (both named FOO:) on line and specify the copy in terms of unit numbers rather than volume names. The system makes the copy and then reminds you that you have two volumes with the same name. It keeps reminding you, if necessary, on

every command until it notices that you have removed one. The manual also points out that you should not replace a disk by another having the same name, for obvious reasons. Since my backup disks all live across the room from the computer, and nothing else has the same name, I don't worry about this restriction.

This has gotten too long.

Good comparison except for one error: my 80-column card on my IIe works fine at 1200 baud. I'm running Softerm and using the Apple Super Serial Card, emulating a VT-100.

My advice is to get whichever has the highest market value, sell it, and buy an IBM PC. If this does not appeal to you, the][e gets my vote. There's more software and peripheral support for it than there will ever be for the ///.

Is there anyone on the net with information on assemblers for the Apple][? If so I would appreciate any information regarding user prefrences. I have used both the assembler in DOS Tool Kit and Lisa 1.5 (Yes that archaic one!) and have been displeased with both. If anybody has used Merlin (Southwestern Data Systems) please let me know how you like it.

Thanks for your time

Does anyone have experience with the Apple Pacal Assembler ? I am
having mysterious problems with an assembly code procedure which
works properly in one host program but not in another. Are there
any known bugs in the Assembler or (perhaps more likely) the
Linker ? How about problems associated with .PUBLIC or .PRIVATE
declarations ? And while I'm at it... Why does the documentation
suggest that LDA @LOC1,Y should be used in place of LDA (LOC1),Y ?
Both seem to produce the same code...

I'm using Apple Pascal 1.1 . Is this the most current release ?

Any help will be greatly appreciated.

Subject: Error handling in Applesotf BASIC
X-Google-Info: Converted from the original B-News header
Posted: Thu Mar 10 09:30:50 1983
Received: Wed Mar 30 04:07:36 1983

The Applesoft BASIC programming reference manual states in page 81:

"Care must be taken when handling errors that occur within FOR...NEXT loops
or between GOSUB and RETURN, as the pointers and RETURN stacks disturbed.
The error-handling routine must *restart* the loop, returning to the FOR or
GOSUB statement, *not* the NEXT or RETURN statement. After error handling,
a return to a NEXT or a RETURN will cause the appropriate message:
?NEXT WITHOUT FOR ERROR or ?RETURN WITHOUT GOSUB ERROR"

I am trying to port a BASIC program written for the TRS-80 with extensive
error handling. My problems/questions (flames?) are:
-How 'disturbed' does the stack get?
-Is this a bug or a feature?

-Does this mean that you can not do error handling within a subroutine?
(only within the main body?). Any solutions?

Does anyone know how to prevent the Apple from reading CTRL-K's as the
character '[' from the keyboard. I have an Apple IIe and have the '['
character on the keyboard so I don't need it. What's bothering me is
that the new UP-CURSOR key is a CTRL-K so that it is interpreted as

a '['. I suspect a patch to SYSTEM.APPLE (similar to the lower-case
patch) would do the trick, but I don't know how SYSTEM.APPLE is
constructed. Any suggestions or comments would be greatly appreciated.
Thanks in advance.

I have an Apple //e with Apples 80 col card and I want
to use it as a terminal on unix. I use vi alot so I would
like a reasonable emulation (like vt100). Others in our
department have apple II+ and videx 80 col cards and we
all have microsoft cp/m cards. The best emulator would be
cp/m based (i.e., not copy protected) and run on all of
our apples. Communications is at 1200 baud using apples
super serial card and 212 modems. Please send recommendations
and experiences.

Just about the best terminal package for the Apple II (or IIe) is Bill
Blue's Ascii Express "Pro". This package supports full terminal
emulation (default as shipped is vt52, but the options are adm3a,
Hazeltine 1500 or soroc with the added option of adding your own.) with
any 80 column board. The package uses interrupts so you can print or
look at your disk directory while recieving a file without losing any
characters. Auto logon routines, auto answer routines with password
protect if desired. A "TWX" mode with answerback. Cristianson protocol

or ascii text file transfers, internal text editor and other very useful features.

He's gone to a great deal of trouble to allow the use of just about anyones printer interfaces, modems or 80 column boards. Its as easy to use a Hays 'Smart Modem' as it is to use a Ventel 103/212, a Novation Apple cat or even an acoustic coupler.

The disks are not copy protected and the program can be transferred to hard disks or duplicated for back up.

If you are using a Novation Apple-cat with the 1200 baud option than the software will speed select on recieve, otherwise you can use the 300 baud modem for dialing and then automatically switch to your Vadic triple or whatever.

I've been quite sucessful using an Apple with "AE PRO" to play rogue or use vi with. All the ascii characters not supported on the Apple's keyboard can be sent using a single prefix character.

Other versions of the package will soon be available for the IBM PC in native mode and soon a generic CP/M version for just about anything else.

Bret Marquis

Subject: Apple Pascal problem
X-Google-Info: Converted from the original B-News header
Posted: Tue Apr 12 16:24:31 1983
Received: Fri Apr 15 20:11:25 1983

There are several possible ways to fix the Apple keyboard
so that Pascal will not translate ^K to [.

1) Ron de Groat has written a book, titled (I think)
   "All About Apple Pascal", which is reputed to
   go very deeply into the guts of the system. He
   has published patches to other parts of the
   system (e.g., how to enter normally unavailable
   characters {}\~ etc) from the keyboard, and I am
   pretty sure this book will contain what you need.
   It is available from the publishers of Call A.P.P.L.E.
   for < $12.00, but (here's the catch, and the reason
   I don't have a copy) you have to join the Apple
   Puget Sound Library Exchange to get it (another ~$40).
   Depending on how desperate you are, you might be tempted.

2) About 2 years ago, de Groat published the above-mentioned
   article in Call A.P.P.L.E. -- I believe the title
   was something like "Hiding code beneath the heap".
   Full source listing was given as well as several ways
   to perform the interfacing.

3) You may be able to beg or borrow a patched version
   of SYSTEM.APPLE from someone who has installed the
   VIDEX keyboard enhancer or another comparable
   keyboard encoder board that provides the Apple with
   a "real" keyboard. I have the board, and am very
   happy with it. The Pascal patch provided with it
   works fine.

Good luck.

A company called `Suntronics' is currently advertising in BYTE.
Among their other offerings is a $99 disk controller for the][which
they claim uses `standard Shugart drives' or words to that effect.
Does anybody know:
     1) does it work at all?
     2) does it use SA400's? or SA400L's? or which other model?
     3) how well does it handle half-track-step and other fancy
        things?
Please reply either to me or to this newsgroup. Thanks.

I have a friend who is using and selling Sugart drives on his system. He has no
Problem with half-track protection techniques. He can use any program avaiable.

Of course Sugart drives must be modified for use with standard Apple disk controlers. He sells the drive,and a drive modification kit w/parts.

I am interested on getting some oppinions on SOFTWARE PROTECTION. Are most of this nets readers for or against it?
Send me your oppinion w/comments?
(I am against it because I have purchased programs that are so PROTECTED that I couldn't boot it!!!!!)

source: Wall Street Journal April 20

Apple has apparently sold Drexel University 3000 MacIntosh machines, 1650 of which will be sold to students next winter for about $1000 each. Apple acknowledges the agreement with Drexel but will only say that it concerns "an unannounced product". First hand experiences related by a Drexel vice president suggest the following (using his words):

  mouse
  video screen, disk drive, keyboard in one unit
  23-24 lbs, can be transported in a soft case
  16-bit microprocessor with 64K min memory
  (they call it the Apple DU--for Drexel University)
  they picked it because it was "easy to use"

You ak[Dsked for our opinions on software protection. The general feeling
at Apple (I have it on good authority) is split right down the middle.
About half the folks like it and hld[D[Dalf don't. The company has stopped
developing protection schemes, so I guess that tells you something.
They say it was just too much work to keep ahead in a losing game
anyway.

Regarding parity for Visiterm, the instructions are on Page 3-6. Concerning
the problem with commas, I have been using Visiterm for about a year,
and have had no problem. You might check the ASCII equivalents of your
host computer ... they may be different, and Visiterm can be modified
to accommodate that.

Subject: 68000 coprocessor card for Apple][
X-Google-Info: Converted from the original B-News header
Posted: Wed May 4 14:42:01 1983
Received: Tue May 10 00:54:30 1983

We recently visited the makers of the Saybrook coprocessor card for the
Apple][. It has an 8 or 12.5 MHz 68000 with 128KB of ram (expandable

to 512KB if you are rich and buy the new 256K ram chips; if you are poor you can wait for the price to come down. The on-board address decoder will handle either type of memory chip). The card fits into a standard Apple slot with a little room to spare (i.e., it has a "nose job" in front). The card has DMA to the Apple memory, which greatly speeds up processor-to-processor communication. A separate power supply is provided.

The operating system is the Softech P-system with Pascal and Fortran (communicates with Apple Pascal and runs 68K Pascal). It supports 64-bit floating point, unlike Apple Pascal. Being interpreted, it is not as fast as the 68K is capable of, but it still goes like a banshee. They are now getting the last bugs out of the Apple to Saybrook software interface (the person we talked to was estimating 2 weeks, but we know how these things have a way of extending themselves...) Even so, it was impressive. The 8 MHz board should run about as fast as the Sage (my memory may fail me, it was my impression that their processor was 6 MHz, but that may have changed). At 12.5 MHz there should be a substantial speed advantage.

They plan to have a UN*X subset available later this year, which would make it even more interesting. The C will be compiled into native code, not interpreted using P-code like Pascal. A hard disk would be desirable for this option. The person we talked to said that UN*X would probably be an inexpensive (~$100?) option, but that this could depend on how much interest there was in it.

Price for the 8 MHz board is $1550 (includes power supply and the P-system software). The 8 MHz board is upgradable to 12.5 for several $100's.

The manufacturer is

Anticipating flames in response to my previous followup ...

The coprocessor board has its own memory which apparently is not accessible over the Apple II bus (the article said the 68000 could access the Apple II memory -- not vice versa). This should make it substantially easier to build sufficiently fast memory for a 12.5MHz processor. In particular, you can attach the memory more or less directly to the 68000 without bothering with bus drivers, arbiters, and the like. You can even punt a memory controller and refresh the RAM from software (a la SUN).

In summary, I COULD be wrong about the 12.5MHz processor not being substantially faster than their 8MHz processor, but I would still be surprised.

There are two types of Apple Fortran, one for the II and one

for the ///. Apple II Fortran can give you a stack overflow
whenever it wants to - the code has bugs. Apple /// Fortran
will give you a stack overflow with insufficient memory, as
in a 128K system, when you try to do graphics.

There exist several software packages that claim to greatly increase
the speed of Apple DOS 3.3. (Pronto-DOS, Diversi-DOS, etc.) An
advertisement for Diversi-DOS states that "Apple DOS 3.3 takes 18 disk
revolutions to read a single track, whereas 'Diversi-DOS' reads or
writes a track in just 2 revolutions".

It it true that DOS 3.3 is this inefficient, or is there some error
detecting, error correcting going on in DOS 3.3 and not in Diversi-DOS?
Does anyone know what types of tricks Diversi-DOS could be doing?
Though this example concerns the Apple][, specifically, could some
of the speedy tricks be conducted for other DOS'es ?

                              Thanks in advance,

What has happened to this news group? Has everyone out there forgotten how to
type? Lets see some questions and maybe some answers. Why don't a few people
do some reviewing of any type of software. This group could be a very active
group. Lets try to make it one.

Does anyone "out there" know which Apples Aztec C runs on? We have a
lot of IIes and a III. Will Aztec C run properly on either of these?
Do you really need two disk drives? Could someone who has used it please
tell me just what functions you get in the libraries that come with it.

On a different note - How about a pointer to a book or something similar
to the reference manuals that used to come with the IIs. Only a rather
simple owner's manual comes with the IIe. I need info on all the little
tidbits: ^C disables, creating your own commands, etc. Does Applesoft
have RAM vectors to various commands, so that you can change where BASIC
goes to execute them? What other (not well documented) useful things
do people in net.land know about the Apple? Let's get some conversation
going here. There hasn't been any in this since our site got on the net!

I've been trying to get vi to work with an Apple II and the ALS Smarterm II 80 column card. I've managed to get everything going except the gotoxy addressing, which would be extremely useful. I can get it to address properly in the y direction, but it tends to screw up along x; it also sticks in superfluous characters (usually a '(').

Has anyone had any better luck?

Here's a question for discussion by Net.micro.apple readers:

I would like to know why anyone with an Apple microcomputer would want CP/M. This question is based on the following assumptions:

1. CP/M on the Apple requires the considerable expense of a Z-80 card and an 80-column card.
2. CP/M is greatly disliked by many people - to judge by comments in many magazine articles, letters to the editor, etc.
3. Apple DOS is a fairly competent and friendly operating system.
4. Apple's UCDS Pascal is an excellent alternate operating system.
5. A great many useful programs are available which run under either DOS or Apple Pascal.

Here are reasons I assume one might want CP/M on an Apple:

a. You don't have to worry about (or waste time and energy trying to overcome) disk copy-protection schemes.
b. You wish to run particular programs (e.g., Word Star) which are only available on CP/M.
c. You think good CP/M programs are cheaper or better supported

than good Apple DOS or Pascal programs.
d. Transferring data between programs is easier under CP/M than it is with most programs that run on the standard Apple.
e. You wish to write or develop programs that can be sold for use on as many non-Apple microcomputer systems as possible.
f. You feel that CP/M is a better environment for the programmer (as opposed to the user who doesn't write programs).
g. You already know CP/M or Z-80 assembly language and don't want to waste time learning Apple DOS or 6502 assembly language.
h. You feel Z-80 code will run faster than 6502 code.
i. You feel that DOS is slow or inefficient.

I have no idea if any of these assumptions are valid. I have only slight BASIC and Pascal programming experience on the Apple II and my experience with CP/M is limited to attempts to learn Word Star and SuperCalc on an old and rather tired Osbourne I. So far these attempts have led me to have a very poor opinion of the Osbourne, Word Star and CP/M.

I know very well that the Apple II, the Apple ///, Apple DOS, Apple Pascal, etc. have many disadvantages. Nevertheless, it seems to me that people are always griping in print about problems that I don't seem to have with my Apple II. Maybe people who get CP/M for their Apples are doing things I don't need to do, or haven't got around to trying to do yet? Maybe people who get CP/M are being misled by all the reports in the media that CP/M is *THE* standard operating system for microcomputers? Maybe I am fooled into thinking CP/M is worse just because it is different?

If anyone in netland has opinions for or against CP/M on the Apple based on actual experience rather than hearsay, I'm sure micro.apple readers would like to hear them. My opinion is that CP/M is greatly over-rated, and if I am mistaken I'd like to find out how and why.

Please post replies to net.micro.apple - I'm trying to stimulate some useful activity in this newsgroup.

For more info about Aztec C, try calling the Manx Software
people in NJ: 201-780-4004. I don't know about the Apple //e,
but I would definitely recommend two drives. The libraries
contain most of the standard I/O package (except for scanf)
and the string functions. There are only a handful of DOS-
related functions that are almost useless. You get source
code for the libraries and the less complex utilities.

I have purchased a software package that handles emulation with any 80 colm. card. It has several terminals that it can emulate. If you are just going for adm3a emulation and a few nice features this one is nice. If anyone comes up with some software that would emulate the HP terminals with inserts and deletes I would like to see that. Oh I forgot to tell you the name of the communications package. It is ASCII EXPRESS "The Professional". I like it. I'd like to here from anyone else out there with AE and their exp. and oppinions.

I have found a few books usefull but none appear to cover the IIe yet. I have a II and I can't believe that the IIe manuals don't tell you how to disable the ctrl-c function. I recommend getting a hold of the II manuals if you want to

do any serious programming. All the features of the II have been supported on the IIe. It is impossible to modify any of Applesoft when you have it in ROM. They do leave you 1 user definable command! This is the & command this command causes a JSR $3F5. You can then create a JMP to your routine and use an RTS to return control to BASIC. Well, well look what Apple says about the & command they say, "The ampersand (&) is intended for the computer's internal use only it is NOT a proper APPLESOFT command. This symbol, ..." This looks like an excuse for not explaining any thing that requires advanced knowledge.

To disable ctrl-c you must insert 2 statements. (Caution! Do not use this with any Applesoft program containing GET statements.
XXXX ON ERR GOTO YYYY
YYYY RESUME
To re-enable crtl-c use a statement with a POKE 216,0.

I have been using my Apple II+ as an intelligent terminal for a little over a year now. I patched dos to change the "init" command to "term". From the command level of Pie Writer 2.2 (the absolute best of the word processors) I merely type "term" to enter a 1200 baud terminal mode, and ^@ to return to Pie. If anyone is interested, I'll post that patch at a later date.

However, I still could not use vi. My apple is equipped

with a Videx 80 collum card, with inverse character set chip. After
much experimenting, I developed the following termcap entry which
works most of the time:

bcx c/o morgan!medea

/.applecap/

```
#The following termcap entry works only with an Apple ][+ that is
# equipped with a Videx 80 collumn card in slot 3. A special routine
# must be installed at the apple end to enable scroll down, here
# indicated with a ^U. The Videx card must have inverse char set.

Apple guts anyone?

One of the first issues (back in '79 or '80?) of the
\Apple Orchard/ had an article written by Jobs, Wozniak,
or someone internal to Apple or Microsoft which listed
entry points to most of Applesoft's command routines.
There are no RAM vectors to the command routines. If
Apple II DOS guts are of interest the book \Beneath
Apple DOS/ (I forget the author's name) is excellent.
Apple monitor guts are well documented in the last
Apple II reference manual before the //e came out.
And, an article in a 1978(?) BYTE describes the video system.

If anyone is interested in exact citations or maybe even
copies let me know.

I have posted a termcap description for the ALS Smarterm II 80-column
card to net.sources; It seems to work fine both for vi and rogue
(the acid test!) and supports most of the features of the card
including cursor movement (gotoxy).

This is a very nice card as it gives you a fully functioning keyboard
(with |~\{}_`^[]) as well as 80 columns, and can be ordered by mail
for under $150 shipping and insurance included.

[[This was submitted earlier but I don't think it went out...]]

A question for discussion by Net.micro.apple readers:

I would like to know why anyone with an Apple microcomputer would want CP/M. This question is based on the following assumptions:

1. CP/M on the Apple requires the considerable expense of a Z-80 card and an 80-column card.
2. CP/M is greatly disliked by many people - to judge by comments in many magazine articles, letters to the editor, etc.
3. Apple DOS is a fairly competent and friendly operating system.
4. Apple's UCDS Pascal is an excellent alternate operating system.
5. A great many useful programs are available which run under either DOS or Apple Pascal.

Here are reasons I assume one might want CP/M on an Apple:

a. You don't have to worry about (or waste time and energy trying to overcome) disk copy-protection schemes.
b. You wish to run particular programs (e.g., Word Star) which are only available on CP/M.
c. You think good CP/M programs are cheaper or better supported than good Apple DOS or Pascal programs.
d. Transferring data between programs is easier under CP/M than it is with most programs that run on the standard Apple.
e. You wish to write or develop programs that can be sold for use on as many non-Apple microcomputer systems as possible.
f. You feel that CP/M is a better environment for the programmer (as opposed to the user who doesn't write programs).
g. You already know CP/M or Z-80 assembly language and don't want to waste time learning Apple DOS or 6502 assembly language.
h. You feel Z-80 code will run faster than 6502 code.
i. You feel that DOS is slow or inefficient.

I have no idea if any of these assumptions are valid. I have only slight BASIC and Pascal programming experience on the Apple II and my experience with CP/M is limited to attempts to learn Word Star and SuperCalc on an old and rather tired Osbourne I. So far these attempts have led me to have a very poor opinion of the Osbourne, Word Star and CP/M.

I know very well that the Apple II, the Apple ///, Apple DOS, Apple Pascal, etc. have many disadvantages. Nevertheless, it seems to me that people are always griping in print about problems that I don't seem to have with my Apple II. Maybe people who get CP/M for their Apples are doing things I don't need to do, or haven't got around to trying to do yet? Maybe people who get CP/M are being misled by all the reports in the media that CP/M is *THE* standard operating system for microcomputers? Maybe I am fooled into thinking CP/M is worse just because it is different?

If anyone in netland has opinions for or against CP/M on the Apple based on actual experience rather than hearsay, I'm sure micro.apple readers would like to hear them. My opinion is that CP/M is greatly over-rated, and if I am mistaken I'd like to find out how and why.

Please post replies to net.micro.apple - I'm trying to stimulate some useful activity in this newsgroup.   "Thanks in advance."

A co-worker of mine just got an Apple][e with an MBI VIP card (which has two serial and one parallel port) and a Hayes Smartmodem 1200, and would like to write a terminal emulator in C for it. Unfortunately, none of the hardware came with documentation on where the i/o buffers

are for the serial ports and how to access them. Anyone in netland know how to read/write to/from the communications port(s)?

No amount of information is too much, so if you know anything that might help send mail to { ... seismo!rlgvax!cvl!nk } (nk is the person who has the machine).

Newsgroup-Apple?

Franklin Ace 100 (Apple-compatible) interfacing problems.

With the I.M.I. ADALAB (equipped with ADA-AMP) interference occurs with the DOS. Is is possible to accumulate voltages and times in a 2-D array or to print them as aquired. Once the timer is started however data can not be stored on disk (in fact the disk drive fails to operate). Consequently all data is at risk or, if printed, must be manually re-entered for linear regression analysis or similar data manipulation.

A subroutine to disable - enable interrupts supplied by the company does not solve the problem.

Has anyone had and overcome similar problems?

Subject: Has anyone heard of DBMS' for Apple ?

I know it sounds funny, but I have seen them in the Apple "Blue Book"
and I would like some more information. The systems I saw had similar
capabilities, such as allowing "unsophisticated" users to design a
screen layout, and then automatically setting up files, along with
allowing design of reports, etc.

I'm interested in systems using SUPERKRAM or some similar Btree
indexing utility, all in BASIC (sorry, that's all their Apple II+ has),
mapping into (but not necessarily) a relational database, and
requiring no more than two disk drives. I'd like to hear about:

     CONQUEST
     REQUEST

or any others you have heard about. I'd like prices, if you have them,
but I'm most concerned about how reliable they are, performance, gripes
you have if you've used them, etc. Any suggestions are welcome;
I'm developing a very small, simple database, but want to save myself
some time. I also want my customer to be able to modify it or to
add applications of his/her own. Speed and space considerations are not
yet important, but may become that way in the future (don't they
always?).

Please respond by e-mail or to net.micro.appl as soon as you can. Thanks.

I recently posted an article on the ALS Smartterm II card I bought
for my Apple. One question that came back in response was
of sufficient interest that I thought I would post my response
to the net.

> I read somewhere that the 80-column cards consume
> a lot of power and may cause overheating of systems
> without some provision for cooling. Has this been your experience?
>
> Also, does the card support lower case with true descenders?

Well, I have a fan which I got some time ago just "in case" I
plugged in more than the vanilla Apple power supply could handle, so
I really can't answer the question as it is posed.
Right now I have cards in slots 0 (16K ramcard), 1 (Printer interface),
2 (Micromodem), 3 (Smartterm II) and 6 (Disc controller/2 discs).
I haven't had any problems. My impression is that the complaints of
high power consumption were true of some of the earlier-designed
80 column cards, but that it isn't much of a problem with the
new ones (which this is).

The characters look very good, and have true descenders on the
lower case.

By the way, I have managed to interface the card with Aztec C
(it's a bit trickier than I expected) and if anyone is in need
of information on doing this, I will be glad to supply it by Snail Mail.

I have been tempted once or twice to try CP/M on my Apple,
but the hardware + software investment stopped me quickly.
I would really like to try MuMath or MuLisp, or some of the
fancy editors, but there is enough software for the standard
Apple to keep me occupied for a long time. I have concluded
that it's only the business customers that buy an Apple, and
then immediately stuff a Z-80 and a Videx board in it to turn
it into a CP/M system. Then I wonder why they bought an Apple
instead of a good Z-80 system!

Why CP/M? The Apple is not a serious business computer without it.
(hold your flames for a minute folks!)
Until the IIe came out, it was a kluge to interface 80-col upper

and lower case into Apple DOS software (commercial variety), and
in many respects it still is. Although Wordstar and Superscribe will
both accomplish the same results, the ease of use of Wordstar (which
automatically utilizes 80-col u/lc) is almost uncomparable. Pascal
with its operating system IS nice, but the amount of software available
is pitiful compared to CP/M. It is also nice to have compatability
(somewhat- mind you) with other machines.

In all fairness- Why CP/M with an Apple?
The answer is obvious: you get the best of both worlds by having the two
largest software databases available for your machine. After buying an
Apple, the extra cost of a Z-80 card is not that much.
